NEW QUESTION # 19

The software security group is conducting a maturity assessment using the Building Security in Maturity Model (BSIMM). They are currently focused on reviewing attack models created during recently completed initiatives. Which BSIMM domain is being assessed?

- A. Governance
- B. Software security development life cycle (SSDL) touchpoints
- C. Intelligence
- D. Deployment

Answer: C

Explanation:

The Intelligence domain in the Building Security in Maturity Model (BSIMM) focuses on gathering and using information about software security. This includes understanding the types of attacks that are possible against the software being developed, which is why reviewing attack models falls under this domain. The BSIMM domain of Intelligence involves creating models of potential attacks on software (attack models), analyzing actual attacks that have occurred (attack intelligence), and sharing this information to improve security measures. By reviewing attack models, the software security group is essentially assessing the organization's ability to anticipate and understand potential security threats, which is a key aspect of the Intelligence domain.

NEW QUESTION # 20

The software security team has been tasked with assessing a document management application that has been in use for many years and developing a plan to ensure it complies with organizational policies. Which post-release deliverable is being described?

- A. Security strategy for M&A products
- B. External vulnerability disclosure response process
- C. Security strategy for legacy code
- D. Post-release certifications

Answer: C

Explanation:

The task described involves assessing a document management application that has been in use for many years. This scenario typically requires a security strategy that addresses the unique challenges of legacy code.

Legacy code refers to software that has been around for a long time and may not have been developed with current security

standards in mind. A security strategy for legacy code would include measures to ensure that the application complies with current organizational policies, which may involve code reviews, updates, and the implementation of modern security practices to mitigate any potential vulnerabilities inherent in older code¹².

NEW QUESTION # 21

Which secure coding best practice says to require authentication before allowing any files to be uploaded and to limit the types of files to only those needed for the business purpose?

- **A. File management**
- B. Memory management
- C. Communication security
- D. Data protection

Answer: A

Explanation:

The secure coding best practice that requires authentication before allowing any files to be uploaded, and limits the types of files to only those needed for the business purpose, falls under the category of File Management. This practice is crucial for preventing unauthorized file uploads, which can be a common vector for attacks such as uploading malicious files or scripts. By enforcing authentication, the application ensures that only legitimate users can upload files. Additionally, restricting the file types to those necessary for business operations minimizes the risk of uploading potentially harmful files that could compromise the system.
