

# Salesforce Integration-Architect Test Practice, Integration-Architect Valid Exam Bootcamp

P.S. Free 2026 Salesforce Integration-Architect dumps are available on Google Drive shared by TorrentExam:  
<https://drive.google.com/open?id=14X9peISfINCQPznhvllzL3KHCRfuwp6>

It might be time-consuming and tired to prepare for the Integration-Architect exam without a specialist study material. So it's would be the best decision to choose our Integration-Architect study tool as your learning partner. Our Integration-Architect study tool also gives numerous candidates a better perspective on the real exam. Having been specializing in the research of Integration-Architect Latest Practice Materials, we now process a numerous of customers with our endless efforts, and we believe that our Integration-Architect exam guide will percolate to your satisfaction.

TorrentExam has special training tools for Salesforce certification Integration-Architect exam, which can make you do not need to spend a lot of time and money but can get a lot of knowledge of IT technology to enhance your skills in a short time. And soon you will be able to prove your expertise knowledge and technology in IT industry. TorrentExam's training courses for Salesforce Certification Integration-Architect Exam is developed by the study of TorrentExam experts team to use their knowledge and experience.

## Integration-Architect Valid Exam Bootcamp - Valid Integration-Architect Study Materials

If you are remain an optimistic mind all the time when you are preparing for the Integration-Architect exam, we deeply believe that it will be very easy for you to successfully pass the Integration-Architect exam, and get the related Integration-Architect certification in the near future. Of course, we also know that how to keep an optimistic mind is a question that is very difficult for a lot of people to answer. As is known to us, where there is a will, there is a way. We believe you will get wonderful results with the help of our Integration-Architect Exam Questions as we have been professional in this field.

The Salesforce Certified Integration Architect certification exam covers a wide range of topics related to Salesforce integration, including data integration, application integration, and identity integration. Integration-Architect exam also covers integration security, governance, and design patterns. Candidates are tested on their ability to design and implement integrations that meet business requirements while adhering to industry best practices and security standards.

The Salesforce Integration-Architect exam consists of 60 multiple-choice questions that need to be completed in 105 minutes. The questions are designed to test the candidate's knowledge and expertise in various areas like data integration, security, and system architecture. Integration-Architect Exam also includes scenario-based questions that require the candidate to apply their knowledge to real-world situations. The Salesforce Integration-Architect certification is a challenging exam that requires a lot of preparation and hard work to pass.

## Salesforce Certified Integration Architect Sample Questions (Q37-Q42):

NEW QUESTION # 37

Northern Trail Outfitters needs to use Shield Platform Encryption to encrypt social security numbers in order to meet a business requirement.

Which two considerations should an Integration Architect do prior to the implementation of Shield Platform Encryption?

Choose 2 answers

- A. Encrypt all the data so that it is secure.
- B. Review shield platform encryption configurations.
- C. Encrypt the data using the most current key.
- D. Use Shield Platform Encryption as a user authentication or authorization tool.

**Answer: A,B**

Explanation:

The considerations that an Integration Architect should do prior to the implementation of Shield Platform Encryption are:

Review shield platform encryption configurations.

Encrypt all the data so that it is secure.

Shield Platform Encryption is a feature that allows you to encrypt sensitive data at rest in Salesforce, such as social security numbers, without compromising critical platform functionality. Before implementing Shield Platform Encryption, you should review the shield platform encryption configurations, such as the encryption key management, the encryption policy, and the encrypted fields and files. You should also encrypt all the data that is subject to encryption, not just the data using the most current key. Encrypting all the data ensures that your data is secure and compliant with your business requirements. Encrypting the data using the most current key is not a valid consideration because Shield Platform Encryption uses a deterministic encryption scheme that does not allow you to rotate or re-encrypt your data with a new key. Using Shield Platform Encryption as a user authentication or authorization tool is not a valid consideration because Shield Platform Encryption is not designed for that purpose. Shield Platform Encryption only encrypts data at rest, not in transit or in use.

#### NEW QUESTION # 38

Universal Containers (UC) is a global financial company. UC support agents would like to open bank accounts on the spot for a customer who is inquiring ab UC products.

During opening the bank account process, the agents execute credit checks for the customers through external agencies. At a given time, up to 30 concurrent rewill be using the service for performing credit checks for customers.

What error handling mechanisms should be built to display an error to the agent when the credit verification process failed?

- A. In case the verification process is down, Use mock service to send the response to the agent.
- B. Handle verification process error in the Verification Webservice API in case there isa connection issue to the Webservice if it responds with an error.
- C. In case the verification process is down, use fire and forget mechanism instead of request and reply to allow the agent to get the response back when the service is bar online.
- D. Handle integration errors in the middleware in case the verification process is down, then the middleware should retry processing the request multiple times.

**Answer: B**

Explanation:

Handle verification process error in the Verification Webservice API in case there is a connection issue to the Webservice or if it responds with an error. This solution ensures that the agent can see an error message when the credit verification process failed, and take appropriate actions. The Verification Webservice API can implement error handling logic to catch any exceptions or errors that occur during the callout to the external agencies, and return a meaningful error message to the agent. The agent can then retry the verification process, or escalate the issue to a supervisor. References: Certification - Integration Architect - Trailhead, [Apex Web Services and Callouts]

#### NEW QUESTION # 39

A developer is researching different implementations of the Streaming API (PushTopic, Change Data Capture, Generic Streaming, Platform Events) and asks for guidance. What should the architect consider when making the recommendation?

- A. Change Data Capture can be published from Apex.
- B. PushTopic Events can define a custom payload.
- C. Change Data Capture does not have record access support.

**Answer: C**

Explanation:

When recommending a streaming solution, the architect must evaluate how each event type handles Record-Level Security (Sharing). Change Data Capture (CDC) is unique because it ignores sharing settings for record change events. This means all records of an enabled object generate change events, regardless of whether a particular user has access to those records in the Salesforce UI.

While CDC disregards record-level sharing, it does respect Field-Level Security (FLS). Delivered events only include the fields that the subscribing user is permitted to access. This is a critical consideration for integrations: if a system requires a "Master" view of all record changes across the enterprise (such as a data warehouse sync), CDC is the appropriate tool because it ensures no data is missed due to user-specific sharing constraints.

In contrast, PushTopic Events (Option A) provide a fixed payload based on a SOQL query and do not allow a "custom" payload in the same sense as Platform Events. Platform Events (Option C) are published from Apex or external APIs, but CDC is a platform-native feature that broadcasts automatically when a database record is modified, rather than being "published from Apex" by a developer.

#### NEW QUESTION # 40

A customer's enterprise architect has identified requirements around caching, queuing, error handling, alerts, retries, event handling, etc. The company has asked the Salesforce integration architect to help fulfill such aspects with their Salesforce program.

Which three recommendations should the Salesforce integration architect make?

Choose 3 answers

- **A. Event handling processes such as writing to a log, sending an error or recovery process, or sending an extra message, can be assumed to be handled by middleware.**
- B. Transform a fire-and-forget mechanism to request-reply should be handled by middleware tools (like ETL/ESB) to improve performance.
- C. Message transformation and protocol translation should be done within Salesforce. Recommend leveraging Salesforce native protocol conversion capabilities as middleware tools are NOT suited for such tasks
- **D. Provide true message queuing for integration scenarios (including orchestration, process choreography, quality of service, etc.) given that a middleware solution is required.**
- **E. Event handling in a publish/subscribe scenario, the middleware can be used to route requests or messages to active data-event subscribers from active data-event publishers.**

**Answer: A,D,E**

Explanation:

The recommendations that the Salesforce integration architect should make to fulfill the requirements around caching, queuing, error handling, alerts, retries, event handling, etc. are based on the best practices and capabilities of the middleware tools. The recommendation B is valid because middleware tools can provide true message queuing for integration scenarios that require asynchronous processing, guaranteed delivery, load balancing, etc. The recommendation D is valid because middleware tools can handle various events that may occur during the integration process, such as logging errors, sending notifications, triggering recovery actions, etc. The recommendation E is valid because middleware tools can support the publish/subscribe pattern for event-driven integration, where the middleware can route messages from publishers to subscribers based on topics or filters. The recommendation A is not valid because transforming a fire-and-forget mechanism to request-reply does not improve performance, but rather increases the latency and complexity of the integration. The recommendation C is not valid because message transformation and protocol translation are tasks that are better suited for middleware tools than Salesforce, as they can handle different formats and protocols more efficiently and flexibly.

#### NEW QUESTION # 41

Northern Trail Outfitters (NTO) has a requirement to encrypt a few widely-used standard fields. NTO also wants to be able to use these fields in record-triggered flows.

Which security solution should an integration architect recommend to fulfill the business use case?

- A. Data Masking
- B. Classic Encryption
- **C. Shield Platform Encryption**

**Answer: C**

Explanation:

To satisfy the requirement of encrypting standard fields while maintaining their functionality within record-triggered flows, Shield Platform Encryption is the recommended architectural solution. 1 Shield Platform Encryption is a modern security layer that allows for encryption at rest while 2preserving critical platform features. Unlike Classic Encryption (Option B)-which is limited to a specific "Encrypted Text" custom field type and often breaks platform features like search and automation-Shield is designed to work with standard fields such as Name, Email, and Phone.

Key architectural considerations for Shield include:

- \* **Compatibility with Automation:** Shield fields can be used in Flows, Apex triggers, and validation rules. This allows NTO to implement the required record-triggered business logic without needing to decrypt the data manually in code.
- \* **Search and Filtering:** By using Deterministic Encryption, Shield allows users to filter and search for records based on encrypted fields, which is often a requirement for "widely-used" standard fields.
- \* **Compliance and Governance:** Shield provides advanced key management (Bring Your Own Key - BYOK) and auditing, ensuring that NTO meets corporate security guidelines while data is being processed by the platform.

Data Masking (Option C) is primarily used for sandboxes to obfuscate PII during testing and is not a production encryption-at-rest solution. By recommending Shield, the architect provides a transparent security model that protects sensitive data without sacrificing the declarative power of Flow Builder.

## NEW QUESTION # 42

.....

The 24/7 support system is there for the students to assist them in the right way and solve their real issues quickly. The TorrentExam Salesforce Integration-Architect can be used instantly after buying it from us. Free demos and up to 1 year of free updates are also available at SITE.
