Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q29-Q34):

NEW QUESTION # 29

Which statement about deploying VMs in a gateway subnet is true?

- A. VMs can be deployed in a gateway subnet only after you deploy the VPN Gateway
- B. VMs are required in a gateway subnet
- C. VMs are not allowed in a gateway subnet
- D. VMs are automatically deployed in a gateway subnet

Answer: C

Explanation:

Azure does not allow the deployment of virtual machines (VMs) in a gateway subnet. The gateway subnet is specifically reserved for Azure VPN Gateway or ExpressRoute Gateway instances, and deploying other resources in it can cause gateway deployment or operation failures.

NEW QUESTION # 30

In the context of Azure Route Server, what is a primary function of the route server subnet?

- **A. Serving as the hub for the exchange of routing information**
- B. Hosting virtual machines for routing propagation purposes
- C. Providing DNS resolution for on-premises networks
- D. Acting as a dedicated subnet to host network virtual appliances (NVAs) with routing propagation capabilities

Answer: A

Explanation:

The route server subnet in Azure is a dedicated subnet that hosts the Azure Route Server, which functions as the hub for dynamic routing information exchange between Azure virtual networks and BGP-enabled network virtual appliances (NVAs) or on-premises routers. It enables seamless and centralized route propagation.

NEW QUESTION # 31

Refer to the exhibits, which show the outputs of two commands taken on a Windows VM running in Azure.

The screenshot shows a Windows command prompt window with the following text:

```
IP address configuration

C:\windows\system32>ipconfig

Windows IP Configuration

Ethernet adapter Local Area Connection:

Connection-specific DNS Suffix  . : 12htgkvlwy3e1kwr2zeco.cloudapp.net
Link-local IPv6 Address . . . . . : fe80::51f1:1be4:a33b:d868%2
IPv4 Address. . . . . : 10.0.1.4
Subnet Mask . . . . . : 255.255.255.0
Default Gateway . . . . . : 10.0.1.1

Trace output

C:\windows\system32>tracert 10.0.2.4

Tracing route to 10.0.2.4 over a maximum of 30 hops
 1      <1 ms      <1 ms      <1 ms  10.0.2.4
Trace complete.
```

Which statement is true about the device with the IP address 10.0.2.4?

- A. It is reachable through FortiGate in transparent mode
- B. It is provided by Azure for routing traffic among subnets
- C. It is on the same subnet as the Windows VM
- **D. It is on the same VNET as the Windows VM**

Answer: D

Explanation:

The trace output shows only one hop to reach 10.0.2.4, indicating that the destination is in the same Azure virtual network (VNet) as the Windows VM. Since the VM's IP is 10.0.1.4 and the destination is 10.0.2.4, they are in different subnets, but Azure allows direct routing between subnets within the same VNet without additional hops.

NEW QUESTION # 32

What is the primary purpose of enabling the IP forwarding setting on FortiGate in Azure?

- A. To prevent source and destination checks on network interfaces
- B. To block incoming and outgoing network traffic
- C. To disable network security group (NSG) rules
- **D. To enable the VM to act as a router**

Answer: D

Explanation:

Enabling the IP forwarding setting on FortiGate (or any NVA) in Azure allows the VM to route traffic that is not destined for itself, effectively enabling it to act as a router or firewall. This is essential for scenarios where FortiGate inspects or filters traffic between subnets or from on-premises to Azure.

NEW QUESTION # 33

Refer to the exhibit.

A high availability, active-active FortiGate with Elastic Load Balancing (ELB) and Internal Load Balancing (ILB) was deployed in your Azure environment.

Which tools can you use to configure synchronization? (Choose two.)

- A. Heartbeat interfaces
- B. FortiGate Clustering Protocol (FGCP)
- C. Software-defined network (SDN) Fabric Connector
- D. Autoscale
- E. FortiManager

Answer: A,B

Explanation:

In a FortiGate active-active HA deployment in Azure, synchronization between instances is achieved using FortiGate Clustering Protocol (FGCP)- This is the primary protocol used to synchronize configuration and session information between HA peers.

Heartbeat interfaces- These interfaces are specifically configured to exchange HA state and sync data between the FortiGate VMs, ensuring cluster consistency.
