Answer: B

Explanation:

Azure assigns MAC addresses in a specific Organizationally Unique Identifier (OUI) range. The MAC address d8-34-99-c5-0A-BC begins with d8-34-99, which is a Microsoft-assigned OUI used in Azure virtual networks. This strongly indicates the output was taken from a VM running in Azure.

NEW QUESTION # 23

A Linux server was deployed in a protected subnet with a dynamic IP address. A FortiGate VM in the internal subnet provides traffic filtering to it, and you must implement a firewall policy using the IP address of the Linux server.

Which feature could help integrate FortiGate using Linux server tags?

- A. Targets Management
- B. Microsoft Entra ID
- C. Service Fabric Cluster
- D. Software-defined network (SDN) connector

Answer: D

Explanation:

The Software-defined network (SDN) connector allows FortiGate to dynamically pull metadata such as tags, IP addresses, and resource groups from Azure resources. This enables automatic policy updates based on dynamic IP changes, such as those of a Linux server in a protected subnet.

NEW QUESTION # 24

You want to take advantage of Azure availability zones for your cloud-based Fortinet deployment.

Which two benefits do Azure availability zones provide? (Choose two.)

- A. Protect applications and data through high availability with fault isolation and redundancy
- B. Enhanced protection for application and data in a single Azure region
- C. Improve database performance and reliability

- D. Protect applications and data across multiple Azure regions

Answer: A,B

Explanation:

Enhanced protection for application and data in a single Azure region - Availability Zones provide physical separation of infrastructure within a single Azure region, protecting against datacenter-level failures.

Protect applications and data through high availability with fault isolation and redundancy - They offer fault isolation and redundancy, enabling high availability for applications and services by distributing them across multiple zones within the same region.

NEW QUESTION # 25

What is a key distinction between Azure Firewall and FortiGate VM in terms of their primary functions?

- A. Azure Firewall is designed exclusively for application layer filtering, while FortiGate VM is suitable for both on-premises and cloud environments.
- B. Azure Firewall is a cloud-native network security service, while FortiGate VM is a network virtual appliance (NVA) that provides comprehensive security functions.
- C. Azure Firewall focuses on network traffic inspection, while FortiGate VM is primarily a web application firewall.
- D. Azure Firewall and FortiGate VM have identical primary functions, and no features differentiation.

Answer: B

Explanation:

Azure Firewall is a cloud-native, fully managed network security service designed to control and log network traffic using Azure policies. In contrast, the FortiGate VM is a network virtual appliance (NVA) that delivers comprehensive security features, including firewalling, IPS, antivirus, VPN, and application control, suitable for both on-premises and cloud deployments.

NEW QUESTION # 26

What characterizes the branch-to-branch topology in an Azure virtual WAN?

- A. Simplified network architecture with reduced hub dependencies
- B. Enhanced security through centralized traffic management
- C. Increased redundancy through multiple connections to the central hub
- D. Improved scalability for branch offices connecting to Azure

Answer: D

Explanation:

The branch-to-branch topology in Azure Virtual WAN is characterized by direct connectivity between branches through the Virtual WAN backbone, which reduces dependency on centralized hubs. This results in a simplified network architecture, lowering latency and optimizing routing between branch locations.
