NEW QUESTION # 34

- A. Protocol options allows administrators a streamlined method to instruct FortiGate to block all sessions corresponding to disabled protocols.
- B. Protocol options allow administrators to configure a maximum number of sessions for each configured protocol.
- **C. Protocol options allows administrators to configure which Layer 4 port numbers map to upper-layer protocols, such as HTTP, SMTP, FTP, and so on.**

NEW QUESTION # 35

What action can be taken on a FortiGate to block traffic using IPS protocol decoders, focusing on network transmission patterns and application signatures?

- A. Use the DNS filter to block application signatures and protocol decoders.
- **B. Use application control to limit non-URL-based software handling.**
- C. Configure a web filter profile in flow mode.

- D. Enable application detection-based SD-WAN rules.

Answer: B

Explanation:

FortiGate's IPS protocol decoders analyze network transmission patterns and application signatures to identify and block malicious traffic. Application Control is the feature that allows FortiGate to detect, classify, and block applications based on their behavior and signatures, even when they do not rely on traditional URLs.

Application Control works alongside IPS protocol decoders to inspect packet payloads and enforce security policies based on recognized application behaviors.

It enables granular control over non-URL-based applications such as P2P traffic, VoIP, messaging apps, and other non-web-based protocols that IPS can identify through protocol decoders.

IPS and Application Control together can detect evasive or encrypted applications that might bypass traditional firewall rules.

- A. Enable SNAT on the relevant firewall policies to prevent RPF check drops.
- B. Disable auto-asic-offload as this is not supported between VRF instances.
- C. Configure RIPv2 to exchange route information between the VRF instances.
- D. Configure route leaking between port3 and port4.
- E. Configure route leaking between VRF 12 and VRF 21.
