Fortinet FCSS - SD-WAN 7.4 Architect Sample Questions (Q42-Q47):

NEW QUESTION # 42
Refer to the exhibit.

```

ike V=root:0:HUB1-VPN1: NAT hole punching for peer at 192.2.0.1:4500
```

Which statement best describe the role of the ADVPN device in handling traffic?

- A. This is a spoke that has received a direct shortcut query from a remote spoke.
- B. This is a hub that has received a shortcut query from a spoke and has forwarded it to another spoke.
- C. This is a spoke that has received a shortcut query from a remote hub.
- D. This is a hub, and two spokes, 192.2.0.1 and 10.0.3.101, establish a shortcut.

Answer: D

Explanation:
The log shows messages on HUB1-VPN1 where the device processes a SHORTCUT_QUERY and performs NAT hole punching (peer at 192.2.0.1:4500). This indicates that the device is acting as a hub, helping two spokes (192.2.0.1 and 10.0.3.101) establish a direct ADVPN shortcut tunnel between each other, instead of routing their traffic through the hub.

NEW QUESTION # 43
As an MSSP administrator, you are asked to configure ADVPN on an existing SD-WAN topology.
FortiManager manages the customer devices in a dedicated ADOM. The previous administrator used the SD- WAN overlay topology.
Which two statements apply to this scenario? (Choose two.)

- A. You can activate auto-discovery VPN in the SD-WAN overlay template only if it is a single hub topology.
- B. When auto-discovery VPN is enabled, FortiManager updates the IPsec and BGP templates in the hub.
- C. After you enable auto-discovery VPN in the overlay template, you must select between ADVPN 2.0 and ADVPN 1.0.
- D. You can activate auto-discovery VPN in the SD-WAN overlay template for any type of topology, including a primary-primary dual-hub topology.

Answer: B,D

Explanation:
When you enable ADVPN (auto-discovery VPN) in the overlay template, FortiManager automatically updates both the IPsec and BGP templates on the hub so that shortcut tunnels can be established dynamically.
ADVPN can be activated in the SD-WAN overlay template for any supported topology, including dual-hub primary-primary, not just single hub.

NEW QUESTION # 44
The FortiGate devices are managed by ForliManager, and are configured for direct internet access (DIA). You confirm that DIA is working as expected for each branch, and check the SD-WAN zone configuration and firewall policies shown in the exhibits.

Then, you use the SD-WAN overlay template to configure the IPsec overlay tunnels. You create the associated SD-WAN rules to connect existing branches to the company hub device and apply the changes on the branches.

After those changes, users complain that they lost internet access. DIA is no longer working.
Based on the exhibit, which statement best describes the possible root cause of this issue?

- A. The SD-WAN overlay template didn't configure a firewall policy to allow traffic through the overlay.
- B. The SD-WAN overlay template redefines the interface gateway addresses if they are defined with metadata variables.
- C. The SD-WAN overlay template updates the SD-WAN template and the rules.
- D. The SD-WAN overlay template defines a zone for each underlay interface and moves the interfaces into those zones.

Answer: D

Explanation:
The SD-WAN overlay template defines a zone for each underlay interface and moves the interfaces into those zones. This statement perfectly describes the likely sequence of events. The template, when applied, re- organizes the interfaces and zones, causing the existing firewall policy that relies on the old zone configuration to fail. This is the most plausible root cause.

NEW QUESTION # 45
Refer to the exhibits.

The interface details, static route configuration, and firewall policies on the managed FortiGate device are shown.
You want to configure a new SD-WAN zone, named Underlay, that contains the interfaces port1 and port2.
What must be your first action?

- A. Delete the firewall policies.
- B. Delete the SD-WAN Zone Test.
- C. Define port1 as an SD-WAN member.
- D. Delete the static routes.

Answer: D

Explanation:
In the exhibits, port2 is already assigned to the SD-WAN zone named Test. An interface can only belong to a single SD-WAN zone, so before you can add both port1 and port2 into the new SD-WAN zone Underlay, you must first delete the SD-WAN Zone Test to free port2.

NEW QUESTION # 46
An administrator is configuring SD-WAN to load balance their network traffic. Which two things should they consider when setting up SD-WAN? (Choose two.)

- A. SD-WAN load balancing is possible only using the best quality and lowest cost (SLA) strategies.
- B. Only the manual and best-quality strategies allow SD-WAN load balancing.
- C. When applicable, FortiGate load balances the traffic through all members that meet the SLA target.
- D. You can select the outbandwidth hash mode with all strategies that allow load balancing.

Answer: C,D

Explanation:
FortiGate load balances traffic across all members that meet the SLA targets, depending on the strategy used.
The outbandwidth hash mode can be selected with load-balancing strategies to distribute traffic based on flow characteristics.
