## Exam Managing-Cloud-Security Registration | Managing-Cloud-Security Reliable Exam Pattern

Our company is widely acclaimed in the industry, and our Managing-Cloud-Security study materials have won the favor of many customers by virtue of their high quality. Started when the user needs to pass the qualification test, choose the Managing-Cloud-Security study materials, they will not have any second or even third backup options, because they will be the first choice of our practice exam materials. Our Managing-Cloud-Security Study Materials are devoted to research on which methods are used to enable users to pass the test faster.

## WGU Managing Cloud Security (JY02) Sample Questions (Q52-Q57):

### NEW QUESTION # 52

Which type of disaster recovery plan (DRP) test requires the whole organization to participate in a scheduled disaster scenario without performing all of the actual tasks?

- A. Parallel
- B. Full
- C. Tabletop
- D. Dry run

Answer: D

Explanation:

A dry run disaster recovery plan test requires broad organizational participation in a simulated disaster scenario without executing all production-impacting tasks. Managing Cloud principles explain that dry run testing validates coordination, communication, and procedural readiness while avoiding the risks of full operational disruption.

In a dry run, teams follow documented recovery steps conceptually or in limited execution, verifying that dependencies, responsibilities, and sequencing are correct. This approach provides higher fidelity than tabletop exercises, which are discussion-based, while avoiding the operational risks of full or parallel tests.

Parallel tests involve running recovery systems alongside production, and full tests execute all recovery actions, often causing service disruption. Therefore, a dry run offers a balanced method to test preparedness across the organization without full execution.

### NEW QUESTION # 53

A user creates new financial documents that will be stored in the cloud. Which action should the user take before uploading the documents to protect them against threats such as packet capture and on-path attacks?

- A. Metadata labeling
- B. Hashing
- C. Encryption
- D. Change tracking

**Answer: C**

Explanation:

Before transmitting sensitive financial data to the cloud, the best defense against interception threats like packet capture and man-in-the-middle attacks is encryption. Encryption protects data in transit by converting plain text into cipher text, which can only be deciphered with the correct keys.

Hashing provides integrity verification but does not secure confidentiality. Change tracking monitors modifications but does not prevent interception. Metadata labeling adds context but does not protect against on-path attackers.

Using strong encryption protocols (e.g., TLS) ensures that even if traffic is intercepted, the attacker cannot read the data. Encryption also aligns with compliance requirements such as PCI DSS, which mandates encryption for financial data during transmission. By encrypting before upload, the user ensures end-to-end confidentiality across potentially insecure networks.

### NEW QUESTION # 54

Which cloud risk is associated with the supply chain due to dependency on legacy internal servers for application delivery to end users?

- A. Outages
- B. Fast run time
- C. Natural disasters
- D. Homomorphic encryption

**Answer: A**

Explanation:

Outages are the primary cloud risk associated with dependency on legacy internal servers for application delivery. Managing Cloud guidance explains that legacy systems often lack redundancy, scalability, and resilience compared to cloud-native architectures.

When applications rely on aging internal infrastructure, failures in hardware, power, or connectivity can interrupt service delivery to end users. These outages can disrupt supply chains, delay transactions, and impact business continuity.

Natural disasters are external events, fast run time is not a risk, and homomorphic encryption is a cryptographic technique.

Therefore, outages represent the correct risk in this context.

### NEW QUESTION # 55

Which strategy provides the highest overall cost savings for an organization implementing a business continuity and disaster recovery (BCDR) plan?

- A. Deploy a hot cloud site.
- B. Implement cross-site replication.
- C. Move all services to the cloud.

- D. Migrate local backups to tape.

**Answer: C**

Explanation:

Moving all services to the cloud provides the highest overall cost savings for organizations implementing BCDR. Managing Cloud guidance explains that cloud-based services reduce capital expenditures, eliminate the need for secondary physical data centers, and leverage on-demand scalability.

Cloud platforms offer built-in redundancy, geographic distribution, and automated recovery capabilities that significantly lower the cost of maintaining separate disaster recovery infrastructure. Pay-as-you-go pricing ensures organizations only pay for resources when needed, further reducing operational expenses.

Hot sites and cross-site replication incur ongoing costs, while tape backups offer lower cost but do not support rapid recovery. Therefore, migrating services to the cloud delivers the most comprehensive cost savings.

#### **NEW QUESTION # 56**

An organization is reviewing a contract from a cloud service provider and wants to ensure that all aspects of the contract are adhered to by the cloud service provider. Which control will allow the organization to verify that the cloud provider is meeting its obligations?

- A. Incident management
- B. Regulatory oversight
- C. Confidential computing
- **D. Continuous monitoring**

**Answer: D**

Explanation:

Continuous monitoring is the control that allows organizations to actively verify that a cloud provider is fulfilling contractual and compliance obligations. This involves automated collection and analysis of operational, security, and performance data. It enables organizations to ensure that service-level agreements (SLAs) are being honored and that compliance requirements are being met in real time.

While regulatory oversight is provided by external authorities and incident management is reactive in nature, continuous monitoring is a proactive approach. It allows customers to maintain visibility into provider operations. Confidential computing focuses on data protection but does not verify contract adherence.

By employing continuous monitoring, organizations establish transparency and accountability. It also supports audit processes by providing evidence that controls remain effective over time. This reduces risk associated with outsourcing critical functions to a cloud provider and ensures resilience against potential provider-side failures.
