## 最新的 AWS Certified Developer AWS-Developer 免費考試真題 (Q48-Q53):

### 問題 #48

A company runs a payment application on Amazon EC2 instances behind an Application Load Balance The EC2 instances run in an Auto Scaling group across multiple Availability Zones The application needs to retrieve application secrets during the application startup and export the secrets as environment variables These secrets must be encrypted at rest and need to be rotated every month. Which solution will meet these requirements with the LEAST development effort?

- A. Store the secrets in AWS Secrets Manager Provision a new customer master key Use the key to encrypt the secrets Enable automatic rotation Configure an Amazon EC2 user data script to programmatically retrieve the secrets during the

### startup and export as environment variables

- B. Save the secrets as base64 encoded environment variables in the application properties. Retrieve the secrets during the application startup. Reference the secrets in the application code. Write a script to rotate the secrets saved as environment variables.
- C. Save the secrets as strings in AWS Systems Manager Parameter Store and use the default AWS Key Management Service (AWS KMS) key. Configure an Amazon EC2 user data script to retrieve the secrets during the startup and export as environment variables. Configure an AWS Lambda function to rotate the secrets in Parameter Store every month.
- D. Save the secrets in a text file and store the text file in Amazon S3. Provision a customer managed key. Use the key for secret encryption in Amazon S3. Read the contents of the text file and read the export as environment variables. Configure S3 Object Lambda to rotate the text file every month.

答案： A

解題說明：

- \* AWS Secrets Manager: Built for managing secrets, providing encryption, automatic rotation, and access control.
- \* Customer Master Key (CMK): Provides an extra layer of control over encryption through AWS KMS.
- \* Automatic Rotation: Enhances security by regularly changing the secret.
- \* User Data Script: Allows secrets retrieval at instance startup and sets them as environment variables for seamless use within the application.

### 問題 #49

An e-commerce site allows returning users to log in to display customized web pages. The workflow is shown in the image below:

An application is running on EC2 instances. Amazon RDS is used for the database that stores user accounts and preferences. The website freezes or is slow to load while waiting for the login step to complete. The remaining components of the site are well-optimized.

Which of the following techniques will resolve this issue? (Choose two.)

- A. Call the database asynchronously so the code can continue executing.
- B. Batch login requests from hundreds of users together as a single read request to the database.
- C. Use an Amazon Application Load Balancer to load balance the traffic to the website.
- D. Implement the user login page as an asynchronous Lambda function.
- E. Use Amazon ElastiCache for MemCached to cache user data.

答案： A,E

### 問題 #50

When you create a table with a hash-and-range key, you must define one or more secondary indexes on that table.

- A. False, when you have Hash-Range key you cannot define Secondary index
- B. False, hash-range key is another name for secondary index
- C. True
- D. False, it is optional

答案： D

解題說明：

When you create a table with a hash-and-range key in DynamoDB, you can also define one or more secondary indexes on that table.

### 問題 #51

How long are the messages kept on an SQS queue by default?

- A. 1 day
- B. If a message is not read, it is never deleted
- C. 4 days
- D. 2 weeks

答案： C

解題說明：

The SQS message retention period is configurable and can be set anywhere from 1 minute to 2 weeks. The default is 4 days and once the message retention limit is reached your messages will be automatically deleted. The option for longer message retention provides greater flexibility to allow for longer intervals between message production and consumption.

#### 問題 #52

A Developer has been asked to create an AWS Lambda function that is triggered any time updates are made to items in an Amazon DynamoDB table. The function has been created, and appropriate permissions have been added to the Lambda execution role.

Amazon DynamoDB streams have been enabled for the table, but the function is still not being triggered.

Which option would enable DynamoDB table updates to trigger the Lambda function?

- A. Increase the maximum execution time (timeout) setting of the Lambda function
- B. Change the StreamViewType parameter value to NEW\_AND\_OLD\_IMAGES for the DynamoDB table
- C. Map an Amazon SNS topic to the DynamoDB streams
- D. Configure event source mapping for the Lambda function

答案： B
