To make your review more comfortable and effective, we made three versions as well as a series of favorable benefits for you. We are concerted company offering tailored services which include not only the newest and various versions of FlashArray-Implementation-Specialist practice materials, but offer one-year free updates services with patient staff offering help 24/7. So, there is considerate and concerted cooperation for your purchasing experience accompanied with patient staff with amity. You can find them on our official website, and we will deal with everything once you place your order.

We try to meet different requirements by setting different versions of our FlashArray-Implementation-Specialist question dumps. The first one is online FlashArray-Implementation-Specialist engine version. As an online tool, it is convenient and easy to study, supports all Web Browsers and system including Windows, Mac, Android, iOS and so on. You can practice online anytime and check your test history and performance review, which will do help to your study. The second is FlashArray-Implementation-Specialist Desktop Test Engine. As an installable FlashArray-Implementation-Specialist software application, it simulated the real FlashArray-Implementation-Specialist exam environment, and builds 200-125 exam confidence. The third one is Practice PDF version. PDF Version is easy to read and print. So you can study anywhere, anytime.

## Authoritative FlashArray-Implementation-Specialist Pdf Braindumps & Passing FlashArray-Implementation-Specialist Exam is No More a Challenging Task

Don't you want to make a splendid achievement in your career? Certainly hope so. Then it is necessary to constantly improve yourself. Working in the Pure Storage industry, what should you do to improve yourself? In fact, it is a good method to improve yourself by taking Pure Storage certification exams and getting Pure Storage certificate. Pure Storage certificate is very important certificate, so more and more people choose to attend FlashArray-Implementation-Specialist Certification Exam.

## Pure Storage Certified FlashArray Implementation Specialist Sample Questions (Q82-Q87):

NEW QUESTION # 82

On a FlashArray//XR4, which port is enabled for the management service by default?

- A. ETH0
- B. ETH4
- C. ETH2

**Answer: A**

Explanation:

Consistent with previous FlashArray generations, the FlashArray//XR4 adheres to the standard port designation for administrative connectivity.

ETH0 is the primary port enabled for the management service by default.

When an Implementation Engineer first connects to a new //XR4 controller to perform the initial IP configuration, they utilize ETH0 (and often ETH1 for redundancy).

These ports are physically labeled for management and are logically separated from the data and replication traffic in the default configuration.

ETH2 and ETH3 are typically reserved or defaulted for replication traffic, while higher-numbered ports (like ETH10+) are used for host I/O or backend shelf connectivity on the R4 platform. Using ETH0 ensures immediate access to the Purity GUI and CLI without requiring custom port reconfiguration.

### NEW QUESTION # 83

What are the default replication ports on all three rack unit (3U) FlashArray models?

- A. ETH0 and ETH1
- B. ETH2 and ETH3
- C. ETH4 and ETH5
- D. ETH6 and ETH7

**Answer: B**

Explanation:

Understanding the default network port assignments on a standard 3U Pure Storage FlashArray (which encompasses models like the //X10, //X20, //X50, //X70, and //X90) is a fundamental requirement for any Implementation Engineer. The rear of the controllers features a standardized set of integrated Ethernet ports that are logically predefined by the Purity operating system upon factory initialization.

The first two ports, explicitly labeled eth0 and eth1, are 1GbE Base-T copper ports. These are strictly reserved and dedicated by default for management traffic (GUI, CLI, SSH, API, and Call Home telemetry to Pure1). They are not designed to handle high-throughput storage workloads.

The next two ports, eth2 and eth3, are high-speed 10GbE/25GbE optical/Twinax ports. By default, Purity provisions these specifically for asynchronous and synchronous replication traffic (including ActiveCluster), as well as IP-based block storage protocols like iSCSI if the customer is not using Fibre Channel. Utilizing eth2 and eth3 ensures that heavy data mobility workloads have the required bandwidth and are physically isolated from lightweight management traffic. Ports like eth4 and eth5 (if present via PCIe expansion cards) are typically configured manually for additional frontend host I/O or File Services, rather than acting as the default replication interfaces.

### NEW QUESTION # 84

A customer would like to consolidate their SAS shelves and wants to evacuate multiple shelves in parallel. What is a prerequisite for this procedure?

- A. The array usage percentage must be lower than 60%
- B. The array chassis must be fully populated with modules.
- C. Purity must be upgraded to 6.x

**Answer: C**

Explanation:

To perform parallel evacuation of multiple SAS shelves, the FlashArray must be running Purity//FA 6.0 or higher.

Prior to Purity version 6.x, the shelf evacuation process (used during capacity consolidation or shelf retirement) was a serialized

operation. An Implementation Engineer had to issue the evacuation command for one shelf, wait for all data to move to other storage within the array, and physically remove that shelf before starting the process for the next one. This could be time-consuming for large clusters of legacy SAS shelves.

With the release of Purity//FA 6.0, Pure Storage introduced significant enhancements to data mobility and background operational efficiency, including the ability to issue evacuation commands for multiple external shelves simultaneously. The system's intelligent scheduler manages the I/O bandwidth to ensure that the parallel data movement does not impact frontend host performance. While having sufficient free space (Option C) is logically necessary to hold the evacuated data, the specific functional capability to trigger concurrent evacuations is a software feature tied strictly to the Purity 6.x code base. Option B is irrelevant to the software capability of the array.

#### NEW QUESTION # 85

A customer needs to have arrays installed and configured with ActiveCluster and ETH replication. The installation document contains 3 IP addresses. How many additional IP addresses are needed?

- A. 0
- B. 1
- C. 2

**Answer: A**

Explanation:

For ActiveCluster with Ethernet replication, a total of 8 IP addresses are typically required; if 3 are already provided, 5 additional IPs are needed to complete the configuration.

#### NEW QUESTION # 86

An Implementation Engineer arrives on site to complete a shelf evac. What action must take place before Pure Support can run the completion commands?

- A. Disconnect the SAS or NVMe cables.
- B. Enable Remote Assist (RA).
- C. Power off the shelf.
- D. Set maintenance tag.

**Answer: B**

Explanation:

A "shelf evacuation" is a non-disruptive capacity consolidation feature. When a customer upgrades to denser flash modules or decommissions older hardware, the Purity operating system transparently migrates all active data blocks off the target DirectFlash Shelf and redistributes them onto the remaining chassis capacity.

Once the GUI and CLI report that the evacuation is 100% complete and the drives are officially empty, the physical data migration is done. However, the Implementation Engineer cannot simply power off the shelf and rip out the cables. The FlashArray's internal database and topology map still retain historical references, WWNs, and hardware associations to that specific shelf and its empty drive bays.

To cleanly purge the shelf from the cluster's active topology and prevent persistent "missing hardware" alerts, Pure Storage Support must execute restricted, backend completion commands (such as the hidden purehw shelf remove script). Because these commands are locked behind advanced engineering privileges, the onsite Implementation Engineer must explicitly Enable Remote Assist (RA). Remote Assist opens a secure, outbound SSH tunnel from the array's Callhome Connection Manager directly to the Pure Storage support cloud, allowing the remote engineer to log in, run the cleanup scripts, and give the onsite engineer the final green light to physically disconnect the hardware.
