Axis Network Video Exam Sample Questions (Q37-Q42):

NEW QUESTION # 37

Which statement is true for broadcast network traffic?

- A. Broadcast is not practical for network video transmission, since packets are transmitted to every device on the network
- B. Broadcast is designed to enable optimized video transmission, since it tolerates network dropouts
- C. Broadcast is a method for sending video to many recipients over the internet even though their bandwidths vary
- D. Broadcast data packet length is longer than normal Ethernet packets, to accommodate a full video frame

Answer: A

NEW QUESTION # 38

When recording a night scene with IR, what is the consequence of using a day-and-night camera without an IR-corrected lens?

- A. The image will flicker
- B. The color fidelity will be poor
- C. The IR light will not be used
- **D. The focus will shift**

Answer: D

Explanation:

When recording a night scene with IR, using a day-and-night camera without an IR-corrected lens can cause the focus to shift. This happens because IR light and visible light have different wavelengths and refract differently through the lens. An IR-corrected lens is designed to handle both types of light without causing a focus shift, ensuring sharp images in both day and night conditions.

NEW QUESTION # 39

An integrator wants to wire an external 12 V relay to the output port of a camera. Which two pins should be used?

- A. IBND&12V
- **B. GND & I/O1**
- C. 12V & I/O1
- D. I/O1 & I/O2

Answer: B

Explanation:

To wire an external 12V relay to the output port of an Axis camera, the GND and I/O1 pins should be used.

The GND (ground) provides the necessary electrical return path, and the I/O1 pin is used for the output signal to control the relay.

According to Axis technical documentation, these connections allow for proper integration and control of external devices such as relays, ensuring they function correctly with the camera's output capabilities.

NEW QUESTION # 40

What is the purpose of an IR-corrected lens?

- A. It is designed to gather more IR light than white light, for low light performance
- B. It blocks IR light during daytime, and white light during night time
- **C. It ensures focus is kept when the camera switches from day to night mode**
- D. It compensates for the color distortions caused by the IR light at daytime

Answer: C

Explanation:

"An IR-corrected lens is designed to keep the image in focus for both visible and infrared light, ensuring the camera stays in focus when switching from day (color) mode to night (IR) mode."

- Axis Communications Academy, Network Video Fundamentals, 2022

"IR-corrected lenses prevent focus shift when the camera switches between visible and infrared illumination."

NEW QUESTION # 41

A P-iris lens is

- A. An iris with higher light sensitivity.
- **B. A DC-iris with feedback.**
- C. Axis' standard for DC-iris.

- D. An iris specially made for zoom lenses.

Answer: B

Explanation:

A P-iris lens is a type of DC-iris lens that incorporates feedback to maintain optimal image quality. Unlike a standard DC-iris, which only adjusts based on light levels, a P-iris lens uses a feedback mechanism to optimize the iris position, ensuring consistent image sharpness, depth of field, and optimal contrast. This technology allows for precise control over the iris, which is especially beneficial in varying lighting conditions. According to Axis documentation, P-iris lenses are designed to deliver better performance by continuously adjusting the iris for optimal image quality.
