Salesforce Certified MuleSoft Developer II Sample Questions (Q15-Q20):

NEW QUESTION # 15

Refer to the exhibit.

When creating a new project, which API implementation allows for selecting the correct API version and scaffolding the flows from the API specification?

- A. Import a published API
- B. Import RAML from local file
- C. Generate a local RAML from anypoint Studio
- D. Download RAML from Design Center

Answer: D

Explanation:

To create a new project that selects the correct API version and scaffolds the flows from the API specification, the developer should import a published API. This option allows importing an API specification that has been published to Anypoint Exchange or Design Center, and selecting a specific version of that API specification. The developer can also choose to scaffold flows based on that API specification. Reference: <https://docs.mulesoft.com/apikit/4.x/apikit-4-new-project-task>

NEW QUESTION # 16

The Center for Enablement team published a common application as a reusable module to the central Nexus repository. How can the common application be included in all API implementations?

- A. Download the common application from Naxus and copy it to the src/main/resources folder in the API
- B. Copy the common application's source XML file and out it in a new flow file in the src/main/mule folder
- C. Add a Maven dependency in the PCM file with multiple-plugin as <classifier>
- D. Add a Maven dependency in the POM file with jar as <classifier>

Answer: D

Explanation:

To include a common application as a reusable module in all API implementations, the developer should add a Maven dependency in the POM file with jar as <classifier>. This way, the developer can reuse Mule code from another application by packaging it as a JAR file and adding it as a dependency in the POM file of the API implementation. The classifier element specifies that it is a JAR file. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/mmp-concept#add-a-maven-dependency-to-the-pom-file>

NEW QUESTION # 17

A company with MuleSoft Titanium develops a Salesforce System API using MuleSoft out-of-the-box Salesforce Connector and deploys the API to CloudHub.

Which steps provide the average number of requests and average response time of the Salesforce Connector?

- A. Access Anypoint Monitoring's built-in dashboard. Select a resource.
Locate the information under the Connectors tab.

- B. Access Anypoint Monitoring's built-in dashboard
Select a resource.
Create a custom dashboard to retrieve the information.
- C. Change the API Implementation to capture the information in the log.
Retrieve the information from the log file.
- D. Access Anypoint Monitoring built-in dashboard.
Select a resource.
Locate the information under Log Manager < Raw Data.

Answer: A

Explanation:

To get the average number of requests and average response time of the Salesforce Connector, the developer should access Anypoint Monitoring's built-in dashboard, select a resource (such as an application or an API), and locate the information under the Connectors tab. The Connectors tab shows metrics for each connector used by the resource, such as average requests per minute, average response time, and failures. Reference: <https://docs.mulesoft.com/monitoring/built-in-dashboard-reference>

NEW QUESTION # 18

A scatter-gather router is configured with four routes: Route A, B, C and D.

Route C false.

- A. Payload ['2']
- B. Payload failures['2']
- C. Error,errorMessage.payload.results ['2']
- D. Error,errorMessage,payload.failures['2']

Answer: C

Explanation:

The result of accessing route C failure is Error,errorMessage,payload.failures['2']. This is because a scatter-gather router returns an aggregated message that contains an array of results from each route and an array of failures from each route. The failures array contains error objects with information about each failed route execution. To access route C failure, which is the third route (index 2), the developer needs to use Error.errorMessage.payload.failures['2'] expression. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/scatter-gather-reference#scatter-gather-output>

NEW QUESTION # 19

A Mule implementation uses a HTTP Request within an Until Successful scope to connect to an API.

How should a permanent error response like HTTP:UNAUTHORIZED be handled inside Until Successful to reduce latency?

- A. Put the HTTP Request inside a try scope in Until Successful.
In the error handler, use On Error Propagate to catch permanent errors like HTTP UNAUTHORIZED.
- B. Configure retrying until a MULERETRY_EXHAUSTED error is raised or the API responds back with a successful response.
- C. In Until Successful configuration, set the retry count to 1 for error type HTTP: UNAUTHORIZED.
- D. Put the HTTP Request inside a try scope in Until Successful.
In the error handler, use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED.

Answer: D

Explanation:

To handle a permanent error response like HTTP:UNAUTHORIZED inside Until Successful, the developer should put the HTTP Request inside a try scope in Until Successful, and use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED in the error handler. This way, the developer can avoid retrying requests that will always fail due to a permanent error, and reduce latency. On Error Continue allows the flow to continue processing after handling the error. Reference:
