```
joe:x:100:100:Joe:/home/joe:/bin/bash
mike:x:101:101:Mike:/home/mike:/bin/sh
kevin:x:102:102:Kevin:/home/kevin:/bin/sh
matt:x:103:103:Matt:/home/matt:/bin/sh
```

What output will be displayed on the screen when the following command is executed:

```
grep -o home myfile.txt
```

- A. /home/joe  
/home/mike  
/home/Kevin  
/home/matt
- B. No output will be displayed on the screen
- C. home  
home  
home  
home
- D. joe  
mike  
Kevin  
matt

**Answer: C**

#### NEW QUESTION # 257

Which shell command is used to continue background execution of a suspended command?

- A. cont
- B. .&
- C. &
- D. exec
- E. bg

**Answer: E**

#### NEW QUESTION # 258

The priority of any process can range from -20 to \_\_\_\_\_. (Provide only the numerical value)

**Answer:**

Explanation:  
19,+19

#### NEW QUESTION # 259

Where does the BIOS search for a bootloader?

- A. Only on the last added storage media.
- B. The BIOS is not responsible to search for a valid bootloader.
- C. On all connected storage media regardless of the boot device order.
- D. Only on hard disk drives in the defined boot device order.
- E. On all connected storage media in the defined boot device order.

**Answer: E**

Explanation:  
Explanation

The BIOS (Basic Input/Output System) is a firmware program that is stored in a ROM chip on the motherboard, and it performs some basic tasks when the system is powered on, such as:

- \* initializing the hardware components and peripherals
- \* performing the power-on self-test (POST) to check the system integrity
- \* selecting a boot device from the boot order list
- \* loading and executing the bootloader program from the boot device

The boot device is the data carrier that contains the bootloader, which is a small program that is responsible for loading and executing the kernel. The boot device can be a hard disk, a USB drive, a CD-ROM, or a network device. The BIOS has a boot order list, which is a sequence of possible boot devices that the BIOS will search for a valid bootloader. The boot order list can be configured by the user through the BIOS setup utility, which is usually accessed by pressing a key such as F2, F10, or Del during the

POST.

The BIOS will search for a bootloader by means of a special signature, which is a sequence of bytes that indicates the presence of a bootloader. The signature is usually located in the first sector of the boot device, which is called the boot sector or the master boot record (MBR). The BIOS will read the boot sector of each boot device in the boot order list, and check if the last two bytes are 0x55 and 0xAA, which are the standard boot signature. If the boot signature is found, the BIOS will load the boot sector into memory and execute it. If the boot signature is not found, the BIOS will move on to the next boot device in the boot order list. If none of the boot devices have a valid boot signature, the BIOS will display an error message such as:

No bootable device - insert boot disk and press any key

References:

- \* How does the BIOS know where the bootloader is located? - Super User
- \* Bootloader: What is it and how does it work? - IONOS

### NEW QUESTION # 260

Which of the following statements are correct when comparing Linux containers with traditional virtual machines (e.g. LXC vs. KVM)? (Choose three.)

- A. Containers on the same host can use different operating systems, as the container hypervisor creates separate kernel execution.
- B. The guest environment for fully virtualized machines is created by a hypervisor which provides virtual and emulated hardware devices.
- C. Fully virtualized machines can run any operating system for a specific hardware architecture within the virtual machine.
- D. Containers are a lightweight virtualization method where the kernel controls process isolation and resource management.
- E. Containers are completely decoupled from the host system's physical hardware and can only use emulated virtual hardware devices.

**Answer: B,C,D**
