CompTIA Network+ Certification Exam Sample Questions (Q385-Q390):

NEW QUESTION # 385

Newly crimped 26ft (8m) STP Cat 6 patch cables were recently installed in one room to replace cables that were damaged by a vacuum cleaner. Now, users in that room are unable to connect to the network. A network technician tests the existing cables first. The 177ft (54m) cable that runs from the core switch to the access switch on the floor is working, as is the 115ft (35m) cable run from the access switch to the wall jack in the office. Which of the following is the most likely reason the users cannot connect to the network?

- A. Mixed UTP and STP cables are being used.
- B. An incorrect pinout on the patch cable is being used.**
- C. The patch cables are not plenum rated.
- D. The cable distance is exceeded.

Answer: B

Explanation:

An incorrect pinout on the patch cable could prevent network connectivity due to mismatched wiring.

Even if the cables are the correct length and type, a pinout issue can cause continuity problems and prevent data transmission.

Proper crimping with the correct pinout is essential for network cables to function. (Reference: CompTIA Network+ Study Guide, Chapter on Network Media and Topologies)

NEW QUESTION # 386

A company recently experienced outages of one of its critical, customer-facing applications. The root cause was an overutilized network router, but the Chief Technology Officer is concerned that the support staff was unaware of the issue until notified by customers. Which of the following is the best way to address this issue in the future?

- A. Syslog collector
- B. Packet capture
- C. SIEM
- D. SNMP**

Answer: D

Explanation:

The best answer is SNMP (Simple Network Management Protocol). SNMP enables monitoring of network devices (routers, switches, firewalls, servers) and provides performance data such as CPU usage, bandwidth utilization, and interface status. In this scenario, if SNMP monitoring had been in place, administrators would have received alerts that the router was overutilized before customers noticed outages.

- A). Packet capture (e.g., Wireshark) is useful for deep troubleshooting but is reactive, not proactive, and not scalable for continuous monitoring.
- C). Syslog collects log messages but generally does not provide proactive resource utilization metrics. It is complementary but not the best fit for this problem.
- D). SIEM aggregates logs and security events for analysis, but the primary requirement here is performance and availability monitoring.

By implementing SNMP monitoring (and potentially integrating it with a network monitoring tool such as Nagios, PRTG, or SolarWinds), the organization can track utilization trends, set thresholds, and automatically generate alerts, thereby preventing downtime from going unnoticed.

NEW QUESTION # 387

A junior network administrator gets a text message from a number posing as the domain registrar of the firm. The administrator is tricked into providing global administrator credentials. Which of the following attacks is taking place?

- A. ARP spoofing
- **B. Smishing**
- C. Vishing
- D. DNS poisoning

Answer: B

Explanation:

Smishing (SMS phishing) occurs when attackers send fraudulent text messages pretending to be a trusted source, tricking the victim into giving up sensitive credentials. Since this came via text message, it qualifies as smishing.

- A . DNS poisoning corrupts name resolution.
- B . ARP spoofing manipulates MAC-to-IP mappings.
- C . Vishing is phishing via voice calls, not text.

NEW QUESTION # 388

Which of the following is enforced through legislation?

- **A. GDPR**
- B. AUP
- C. Code of conduct
- D. EULA

Answer: A

Explanation:

GDPR (General Data Protection Regulation) is a legal framework enforced by the European Union to protect personal data and privacy. Unlike internal organizational policies such as AUPs or codes of conduct, GDPR is a legislated regulation, and organizations must comply or face legal consequences.

NEW QUESTION # 389

A network technician is troubleshooting network latency and has determined the issue to be occurring between two network switches (Switch10 and Switch11). Symptoms reported included poor video performance and slow file copying. Given the following information:

```

Switch10 *show interfaces* output
MTU 1600 bytes, Speed 1000/full, VLAN10
12912 packets input, 2398471 bytes, 0 runts, 0 giants
19328 packets output, 9832984 bytes, 0 runts, 0 giants

Switch11 *show interfaces* output
MTU 1500 bytes, Speed Auto Negotiate, VLAN10
19328 packets input, 9832984 bytes, 0 runts, 2394 giants
12912 packets output, 2398471 bytes, 0 runts, 0 giants

```

Which of the following should the technician most likely do to resolve the issue?

- A. Configure STP on both switches.
- B. Disable automatic negotiation on Switch11.
- C. Modify Switch10 MTU value to 1500.
- D. Change the native VLAN on the ports.

Answer: C
