Reliable Exam IBM C1000-200 Pass4sure & C1000-200 Actual Test Pdf

IBM is one of the most powerful and rapidly growing fields nowadays. Everyone is trying to get the IBM C1000-200 certification to improve their futures with it. Success in the test plays an important role in the up gradation of your CV and getting a good job or working online to achieve your dreams. The students are making up their minds for the IBM C1000-200 test but they are mostly confused about where to prepare for it successfully on the first try.

IBM MQ v9.4 Administrator - Professional Sample Questions (Q260-Q265):

NEW QUESTION # 260

In IBM MQ, which configuration approach correctly explains the use of cluster workload balancing, including how messages are automatically routed to the least busy queue manager in a cluster, how cluster repositories maintain topology information, and how sender and receiver channels work together to optimize throughput for multiple applications?

- A. Clustering duplicates messages to all queue managers without considering workload
- **B. Cluster workload balancing automatically routes messages to the least busy queue manager using cluster repositories for topology and sender/receiver channels for communication**
- C. Clustering only replicates queues to other queue managers without distributing workload
- D. Clustering requires manual routing to balance workload

Answer: B

Explanation:

IBM MQ cluster workload balancing uses cluster repositories to maintain information about queue managers, and sender/receiver channels automatically route messages to distribute workload efficiently, optimizing performance.

NEW QUESTION # 261

In IBM MQ, when integrating multiple applications across different operating systems, which feature ensures that messages can be exchanged reliably and securely while supporting automatic reconnection in case of network interruptions?

- **A. Channels with automatic client reconnection and SSL encryption**
- B. Shared memory queues
- C. Non-persistent messaging without transactions
- D. Application-level error handling only

Answer: A

Explanation:

MQ channels with automatic client reconnection and SSL provide secure and reliable message delivery even if network issues occur, ensuring interoperability between different systems.

NEW QUESTION # 262

In IBM MQ, how does the use of shared queues in a cluster environment facilitate load balancing, including how multiple queue managers can process messages from a single queue, reduce bottlenecks, and ensure high availability for critical applications?

- A. Shared queues in clusters replicate messages but do not affect workload distribution
- B. Shared queues only provide backup copies of messages
- C. Shared queues are used only for testing and do not support production environments
- **D. Shared queues allow multiple queue managers in a cluster to process messages from the same queue, automatically distributing workload and improving availability**

Answer: D

Explanation:

Shared queues in clustered queue managers enable multiple instances to process messages from a common queue, balancing workload, reducing bottlenecks, and increasing availability for high-priority applications.

NEW QUESTION # 263

In IBM MQ, channels are used to transfer messages between queue managers. If you need to establish a highly secure channel that supports encryption, authentication, and integrity checks while minimizing the risk of unauthorized access, which type of channel and configuration should be applied?

- A. Standard sender-receiver channel without SSL
- **B. Server-connection channel with SSL/TLS certificates and CHLAUTH rules**
- C. Requester channel with default security exit

- D. Cluster-sender channel without authentication

Answer: B

Explanation:

A server-connection channel with SSL/TLS certificates combined with CHLAUTH rules provides secure encrypted communication with authentication and access control.

NEW QUESTION # 264

In the context of IBM MQ security, which combination of mechanisms ensures that both the identity of the sending application is verified and the messages themselves are protected from unauthorized access during transmission?

- A. Message persistence ensures messages cannot be altered during transmission.
- B. Dead Letter Queues prevent unauthorized messages from being delivered.
- **C. Channel authentication records the sender identity, while SSL/TLS encryption ensures message confidentiality and integrity.**
- D. MQ clustering automatically encrypts messages and verifies user credentials.

Answer: C

Explanation:

Channel authentication combined with SSL/TLS encryption provides both sender verification and message security, which is essential for secure communication in MQ.
