

AP-202 Valid Test Materials - AP-202 Hottest Certification

What's more, part of that CramPDF AP-202 dumps now are free: <https://drive.google.com/open?id=176AxqzAPadndVxnbmrZukiXjV-tcdzJP>

CramPDF provides thousands of examinations training materials especially for Salesforce certifications. We not only provide key knowledge points and detailed questions answers and explanations but also excellent after-sale service. You purchase AP-202 latest practice exam online, you will not only get exam materials but also one year tracking service. We will always provide AP-202 latest practice exam online the first time for your free downloading within one year.

Our AP-202 Test Braindumps boost high hit rate and can stimulate the exam to let you have a good preparation for the exam. Our AP-202 prep torrent boost the timing function and the content is easy to be understood and has been simplified the important information. Our AP-202 test braindumps convey more important information with less amount of answers and questions and thus make the learning relaxed and efficient. If you fail in the exam we will refund you immediately. All B2B Commerce for Developers Accredited Professional exam torrent does a lot of help for you to pass the exam easily and successfully.

New AP-202 Valid Test Materials | Efficient AP-202 Hottest Certification: B2B Commerce for Developers Accredited Professional 100% Pass

The high efficiency method is targeted learning rather than comprehensive learning. Comprehensive learning can improve your basic knowledge but it is not the best to clear exams and obtain certifications. Our valid Salesforce AP-202 exam cram review can help you pass this subject in a short time. If your goal is passing all exams and obtain a useful certification. The best shortcut is to buy Valid AP-202 Exam Cram Review. Most experienced people can prove that. Good products are here waiting for you.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q211-Q216):

NEW QUESTION # 211

Which handlebars helper expression is used in Salesforce B2B Commerce pages and components to toggle the display of a block of markup?

- A. `{{#ifConfig 'Field__c'}} ... {{/ifConfig}}`
- B. `{{#ifStoreSetting 'Field__c'}} ... {{/ifStoreSetting}}`
- C. `{{#ifDisplay 'Page.cfg'}} ... {{/ifDisplay}}`
- D. `{{#ifSetting 'Page.cfg'}} ... {{/ifSetting}}`

Answer: A

Explanation:

The handlebars helper expression that is used in Salesforce B2B Commerce pages and components to toggle the display of a block of markup is `{{#ifConfig 'Field__c'}} ... {{/ifConfig}}`. This expression will evaluate the value of the configuration setting with the

API name `Field__c` and render the block of markup if the value is true, or skip it if the value is false. For example, `{{#ifConfig 'CO.showMiniCart'}} <div id='mini-cart'> ... </div> {{/ifConfig}}` will render the mini-cart div only if the configuration setting `CO.showMiniCart` is true. Salesforce B2B Commerce and D2C Commerce Developer Guide, Handlebars Helpers

NEW QUESTION # 212

Which Lightning web component path allows a developer to view or edit a record while maintaining control over specifying its layout and set of fields?

- A. lightning-record-edit-form
- B. lightning-record-imperative
- C. lightning-record-view-form
- D. lightning-record-form

Answer: A

Explanation:

The lightning-record-edit-form component allows a developer to view or edit a record while maintaining control over specifying its layout and set of fields. This component provides a way to create forms that respect the field-level security and layout configuration defined in the Salesforce metadata. The developer can use lightning-input-field components inside the form to display and edit the fields of a record. The other options are incorrect because they either do not allow editing the record, do not respect the metadata configuration, or do not exist as valid component paths. lightning-record-edit-form | Lightning Web Components Developer Guide

NEW QUESTION # 213

In checkout, what event should the developer's code listen for in order to help troubleshoot and respond to actions?

- A. CommerceActionEvents
- B. CommerceBubbleEvents
- C. CommerceErrorEvents
- D. CommerceDiagnosticEvents

Answer: D

Explanation:

To help troubleshoot and respond to actions in checkout, the developer's code should listen for CommerceDiagnosticEvents. CommerceDiagnosticEvents is an event that is fired by Salesforce B2B Commerce when an error occurs in the storefront. CommerceDiagnosticEvents contains information about the error, such as error code, error message, error type, and error details. CommerceDiagnosticEvents can be subscribed by other components or services that want to handle or display the error information in different ways. The developer's code can listen for CommerceDiagnosticEvents using `anaura:handlertag` in Aura Components or an `@wire` decorator in Lightning web components. The developer's code can also use the event information to perform custom logic or actions based on the error, such as logging, reporting, or notifying. CommerceBubbleEvents is not an event that the developer's code should listen for in checkout, as it is not related to troubleshooting or responding to actions. CommerceBubbleEvents is an event that is fired by Salesforce B2B Commerce when a user interacts with a bubble component in the storefront. A bubble component is a user interface element that displays information or options in a pop-up window when clicked or hovered over. CommerceBubbleEvents contains information about the user interaction, such as bubble name, bubble type, and bubble value. CommerceErrorEvents is not an event that the developer's code should listen for in checkout either, as it is not related to troubleshooting or responding to actions. CommerceErrorEvents is an event that is fired by Salesforce B2B Commerce when a validation error occurs in the storefront. CommerceErrorEvents contains information about the validation error, such as field name, field label, and error message. CommerceActionEvents is not an event that the developer's code should listen for in checkout either, as it is not related to troubleshooting or responding to actions. CommerceActionEvents is an event that is fired by Salesforce B2B Commerce when a user performs an action in the storefront. CommerceActionEvents contains information about the user action, such as action name, action type, and action parameters. NEW QUESTION # 214

Which two log levels does a developer need to include to debug platform events?

- A. Apex Code
- B. Database
- C. Workflow
- D. Callout

Answer: A,C

NEW QUESTION # 215

A developer needs to implement a custom Lightning web component (LWC) for the storefront.

The LWC contains language-specific text values.

How should the developer translate the text values?

- A. Create a custom Metadata object for the text values and query it in the LWC.
- B. Create custom labels for the text values and import them in the LW
- C. Import static resources for the text values and add them into the LWC.
- D. Use a CustomLabel xml file in the LWC to add the text values there.

Answer: B

Explanation:

Custom labels are text values that can be translated into any language that Salesforce supports. They are useful for displaying language-specific text in Lightning web components. To use custom labels in a LWC, the developer needs to create them in the Setup menu and assign them to a language and a value. Then, the developer can import them in the LWC using the `@salesforce/labelScoped` module. For example, if the developer has a custom label named `welcomeHeader`, they can import it as follows:

```
import welcomeHeader from '@salesforce/label/c.welcomeHeader';
```

Then, they can use it in the HTML template or the JavaScript file of the LWC. For example, in the HTML template, they can use it as follows:

HTMLAI-generated code. Review and use carefully. More info on FAQ.

```
<template>
```

```
<h1>{welcomeHeader}</h1>
```

```
</template>
```

The custom label will automatically display the translated value based on the user's language preference. The developer can also use the `lightning-formatted-text` component to format the custom label value with HTML tags.

The other options are not correct because:

A) Importing static resources for the text values is not a recommended way to translate text values in a LWC. Static resources are files that are stored in Salesforce and can be referenced by applications. They are not designed for storing language-specific text values and they do not support automatic translation based on the user's language preference.

B) Using a CustomLabel xml file in the LWC to add the text values there is not a valid option. Custom labels are not stored in xml files, but in the Setup menu. They cannot be added directly to the LWC, but they need to be imported using the `@salesforce/labelScoped` module.

D) Creating a custom Metadata object for the text values and querying it in the LWC is not a feasible option. Custom Metadata objects are records that store configuration data that can be deployed and packaged. They are not intended for storing language-specific text values and they do not support automatic translation based on the user's language preference. Querying them in the LWC would also require an Apex class and a wire service, which would add unnecessary complexity to the solution.

Use Custom Labels in Lightning Web Components

Custom Labels
