UiPath Certified Professional Agentic Automation Associate (UiAAA) Sample Questions (Q51-Q56):

NEW QUESTION # 51

What is a key feature of zero-shot prompting?

- A. It requires at least one example in the prompt for efficient completion.
- **B. The model performs tasks without prior examples or training specific to the request.**
- C. It ensures the model has been fine-tuned for all tasks it encounters.
- D. This is necessary for complex or nuanced scenarios.

Answer: B

Explanation:

The correct answer is A- zero-shot prompting refers to asking an LLM to perform a task without providing any prior examples in the

prompt. In UiPath Agentic Automation, this is considered the simplest form of task prompting and is often used when:

- * The request is straightforward or familiar to the LLM
- * There's no need for detailed context or task demonstration
- * You want rapid generation without lengthy prompt design

UiPath distinguishes zero-shot, few-shot, and chain-of-thought prompting as part of its Prompt Engineering Toolkit. While zero-shot is fast and scalable, it's not ideal for nuanced or ambiguous tasks, which often benefit from few-shot examples or structured reasoning steps.

Option B is misleading - complex scenarios usually require more grounding.

C contradicts the definition of zero-shot.

D confuses prompting with model fine-tuning, which is a separate concept.

Zero-shot works well for common, templated tasks (e.g., classifying "Is this urgent?") but is less reliable in dynamic, multi-intent agent behaviors.

NEW QUESTION # 52

Why would you choose the Argument input method for an activity field?

- A. Applies one constant value you enter during design every time the agent executes the activity.
- **B. Receives a runtime value from an agent input argument defined earlier in the workflow.**
- C. Prompts a person to supply the value each time the field is evaluated at runtime.
- D. Lets the agent infer the field value at runtime using the Description and its reasoning.

Answer: B

Explanation:

B is correct - the Argument input method is used when you want a field in an activity (such as a tool, API call, or process input) to dynamically receive a value at runtime, passed via agent input arguments defined earlier in the flow.

This setup is critical for:

- * Contextual automation: e.g., if the user or upstream system provides a value like Customer_ID, that same value can be used in downstream tools.
- * Reusability: One workflow can behave differently based on argument values passed at runtime (e.g., from Orchestrator triggers, API calls, or user prompts).
- * Maintainability: Centralizing inputs allows for consistent data mapping and easier debugging.

Here's how it works:

- * You define an input argument in the agent's Data Manager (e.g., {{CUSTOMER_EMAIL}})
- * In the activity, you set the input method to Argument, and reference the same name
- * At runtime, UiPath automatically maps the values based on the execution context Option A is describing the Static input method. C refers to the Prompt method, where the LLM infers values.

D is incorrect - that's the Prompt for user input, not the Argument flow.

In summary, choosing Argument enables your agent to behave dynamically and intelligently, using external or user-provided data without hardcoding.

NEW QUESTION # 53

A developer is implementing a few-shot structured prompt for an email classification task. The prompt includes examples of email subjects labeled with their respective classifications, such as "Spam" or "Work." What is the most important aspect to consider when selecting examples for the prompt?

- **A. Choose examples that are diverse, relevant, and typical of the task's expected input.**
- B. Always use more than 10 examples, regardless of task complexity.
- C. Use random and unrelated examples to test the prompt's robustness.
- D. Include examples with intentionally incorrect labels to improve training.

Answer: A

Explanation:

The correct answer is C - the most critical aspect of designing a few-shot prompt in UiPath's LLM-driven agent framework is selecting examples that are diverse, representative, and relevant to the actual data the agent will encounter in production.

In a few-shot structured prompt, examples are used to demonstrate a pattern the model should follow.

UiPath recommends:

- * Using realistic examples from actual user inputs or support tickets

* Covering edge cases or variations in phrasing and tone

* Matching the desired output structure exactly (e.g., Input: ..., Output: ...) These patterns help the LLM infer the task correctly and maintain consistency, especially when processing unstructured inputs like email subjects.

Option A is incorrect - introducing incorrect labels degrades performance and adds confusion.

B is wrong - the number of examples depends on the task complexity and token budget. Sometimes 3-5 is ideal.

D undermines task alignment - random examples reduce accuracy and coherence.

UiPath's Prompt Engineering best practices prioritize grounded, contextually rich inputs, particularly when automating classification tasks like spam detection, triage, or intent recognition. High-quality, task-aligned examples lead to more reliable, human-like agents.

NEW QUESTION # 54

In a UiPath Agent, which statement best captures the essential purpose of a system prompt?

- A. It declares the agent's role, overall goal, and operating constraints, and tells the agent when to invoke tools or escalate tasks to a human reviewer.
- B. It mainly lists output-formatting tags the agent must include, leaving role and goal definition to the user prompt.
- C. It must enumerate every possible dialogue path the agent could encounter so the model can simply pick a preset answer.
- D. It is used only to preload enterprise context and never influences the agent's decision to call tools.

Answer: A

Explanation:

A is correct - in UiPath's agent framework, a system prompt serves as the agent's core grounding mechanism. It is responsible for:

* Defining the agent's identity ("You are an IT support assistant...")

* Outlining its goal ("Your job is to classify, triage, and resolve tickets...")

* Setting operational boundaries and behaviors

* Specifying when to escalate to a human or use tools

This aligns with UiPath's Context Grounding strategy, which separates system prompts, user prompts, and tools orchestration. The system prompt provides persistent context, guiding the LLM's behavior consistently across user interactions and actions.

Option B downplays its influence - which is critical.

C reduces it to output formatting, which is only a small part.

D is unrealistic - LLMs generalize; they don't require enumerating every path.

Correct system prompting ensures safe, consistent, goal-aligned behavior from the agent across dynamic scenarios.

NEW QUESTION # 55

What is the significance of the "as-is" process map in identifying agentic automation opportunities?

- A. It defines the current way tasks are performed, helping to highlight inefficiencies, bottlenecks, and areas for improvement that can uncover automation potential.
- B. It directly outlines the roles that agents will assume in the optimized process, ensuring alignment with automation requirements.
- C. It serves as a finalized map of processes ready for automation, removing the need for further adjustments or workshops.
- D. It establishes the goals of the new process, serving as a foundation to later create the "to-be" process map.

Answer: A

Explanation:

The correct answer is A - the "as-is" process map is a foundational tool in UiPath's Agentic Blueprint Design framework. It visualizes the current state of how work is performed, enabling teams to:

* Identify manual, repetitive, or time-consuming tasks

* Spot delays, rework loops, or human bottlenecks

* Discover areas where agents can augment or replace tasks

It acts as a baseline diagnostic, not an implementation-ready flow.

This is a key step in workshops led by process owners or business SMEs, before designing the "to-be" process where agents are introduced.

B is incorrect - the as-is map is not final.

C refers to the optimized state, not the current one.

D confuses the mapping's role - it captures the present, not the goals.
