

API API-SIEE VCE Dumps | API-SIEE Prep Guide

If you face any problem while using the offline or online software Source Inspector Electrical Equipment (API-SIEE) practice exam of PDFDumps, contact our customer service team. Our team of experts is available 24/7 for your assistance while using updated API-SIEE Exam Prep material. Many takers of the Source Inspector Electrical Equipment (API-SIEE) practice test suffer from money loss because it introduces new changes in the content of the test.

The name of these formats are API API-SIEE PDF dumps file, desktop practice test software, and web-based practice test software. All these three API Cloud API-SIEE practice test formats are easy to use and perfectly work with all devices, operating systems, and web browsers. The API-SIEE Pdf Dumps file is a simple collection of Real and Updated Source Inspector Electrical Equipment (API-SIEE) exam questions in PDF format and it is easy to install and use.

API API-SIEE Prep Guide - Latest API-SIEE Exam Cost

If you have registered API API-SIEE test, you can enter our PDFDumps API API-SIEE. You may try our PDFDumps API API-SIEE free demo to decide whether to buy or not. You can also download pdf real questions and answers. PDFDumps API API-SIEE certification training must help you to pass the exam easily. Its practice test is the most effective. We promise to help you to get the certification. Without the certification, we will give you FULL REFUND of your purchase fees. On request we can provide you with another exam of your choice absolutely free of cost.

API Source Inspector Electrical Equipment Sample Questions (Q87-Q92):

NEW QUESTION # 87

According to NFPA 70, an insulated conductor used within a switchboard or switchgear shall be rated not less than the voltage applied to it and:

- A. totally enclosed.
- B. grounded.
- C. flame retardant.
- D. water proof.

Answer: C

Explanation:

The correct answer is B because NFPA 70 requires conductors used inside switchboards and switchgear to be suitable not only for the circuit voltage, but also for safe operation within enclosed electrical assemblies where fault energy, heating, and fire propagation are important concerns. In this context, flame-retardant insulation is required so that internal wiring does not readily support combustion or allow fire to spread inside the equipment lineup. This is especially important during abnormal conditions such as arcing, overheating, insulation failure, or short-circuit events.

Within the API Guide for Source Inspection and Quality Surveillance of Electrical Equipment, switchgear is one of the major covered equipment categories for source inspection and quality surveillance activities. The guide emphasizes that source inspectors must verify compliance with governing specifications, referenced codes, approved drawings, and applicable industry standards during manufacturing and inspection. It also states that the guide focuses on source inspection and quality surveillance activities rather than detailed design engineering alone. Therefore, when inspecting switchgear internal wiring, confirming that conductor insulation is properly voltage-rated and flame retardant is the correct code-based requirement.

NEW QUESTION # 88

According to NEMA ICS 2, a provision for pad locking shall be provided:

- A. on the wireway to prevent opening the wireway on the motor control center.
- B. on the door to prevent opening the combination starter door.
- C. on the external operating handle.
- D. on the rear door of the low voltage motor control center.

Answer: C

Explanation:

The correct answer is B. Under NEMA ICS 2 for motor controllers and combination starters, the required provision for padlocking is associated with the external operating handle. This arrangement allows the disconnecting means or operating mechanism to be secured in the desired position, typically for safety isolation and lockout purposes during maintenance or inspection. It is a functional safety feature tied directly to operation of the controller, not merely to enclosure access.

The other options are not the standard requirement in this context. Padlocking the door, wireway, or rear door may be used in some installations for security or restricted access, but those are not the specific NEMA ICS 2 provisions identified for the controller operating mechanism itself. The standard intent is to ensure that the operating handle can be locked so the equipment cannot be unintentionally operated while personnel are working on or near it.

From an API source inspection perspective, this falls under verification of MCC construction details, safety features, interlocks, and compliance with applicable referenced standards during shop inspection and quality surveillance. Therefore, the correct answer is on the external operating handle, which makes option B the verified answer.

NEW QUESTION # 89

Which referenced standard in the guide applies to metal-enclosed low-voltage power circuit breaker switchgear?

- A. API RP 14FZ
- B. NEMA 250 only
- C. ANSI/IEEE C37.20.1
- D. ANSI/IEEE C57.12.00

Answer: C

NEW QUESTION # 90

Which information should be included at a minimum in a source inspection report?

- A. Inspector's travel reimbursement total
- B. Internal purchaser budget code only
- C. Reference drawings/data used, including drawing numbers
- D. Supplier profit margin

Answer: C

NEW QUESTION # 91

According to IEEE 841, unless otherwise specified, all electrical performance tests shall be conducted in accordance with:

- A. IEEE Std 522.
- B. IEEE Std 112.
- C. NEMA MG-1.
- D. IEEE Std 117.

Answer: B

Explanation:

The correct answer is B, IEEE Std 112. IEEE 841 applies to severe-duty, totally enclosed squirrel-cage induction motors used in petroleum and chemical industry service, and when it refers to electrical performance testing, the standard points to IEEE Std 112 as

the governing test method unless the purchase specification states otherwise. IEEE Std 112 is the recognized standard for defining methods to determine motor performance characteristics such as efficiency, losses, current, power factor, and related operating behavior during testing.

The other options are not the best answer for this question. NEMA MG-1 is a broad motor standard covering design, construction, and application requirements, but it is not the primary referenced document for conducting electrical performance tests in this context. IEEE Std 117 relates more to test procedures and acceptance considerations for certain motor categories, but not the default performance-test basis cited here.

IEEE Std 522 is associated with insulation testing of form-wound stator coils and windings, not overall motor electrical performance testing.

Therefore, for source inspection of large electric motors, the correct referenced performance-test standard is IEEE Std 112.

NEW QUESTION # 92

.....

API PDF Questions format, web-based practice test, and desktop-based API-SIEE practice test formats. All these three API-SIEE exam dumps formats features surely will help you in preparation and boost your confidence to pass the challenging API-SIEE Exam with good scores.
