VMware vSphere Foundation 9.0 Administrator Sample Questions (Q21-Q26):

NEW QUESTION # 21

An administrator needs to ensure that only specific users can manage the virtual machines (VM) in a specific VMware vCenter folder.

Which three steps are required to accomplish this? (Choose three.)

- A. Apply the role to the specific vCenter folder.
- B. Create a new role in vCenter with VM management permissions.
- C. Create a datastore cluster.
- D. Assign the new role to the appropriate users/groups.
- E. Add the identity source to vCenter.

Answer: A,B,D

Explanation:

To ensure that only specific users can manage VMs in a specific VMware vCenter folder, the following three steps are required:

* Create a new role in vCenter with VM management permissions(Answer B):You must define a custom role tailored to managing VMs, which includes permissions such as powering on/off VMs, editing VM settings, and accessing consoles. This role must include the appropriate privileges under the

"Virtual machine" category in vCenter permissions.

* Apply the role to the specific vCenter folder(Answer C):The custom role needs to be applied directly to the target vCenter folder. This enables scope-based access control, where permissions are applied only to VMs within that folder.

* Assign the new role to the appropriate users/groups(Answer A):After creating the role and applying it to the folder, the role must be associated with the correct users or groups. This step uses the vCenter Server's identity source integration to assign roles.

Why the other options are incorrect:

* D. Add the identity source to vCenter:This is a prerequisite step for any role assignment but is not directly required in this specific scenario if the identity source is already configured.

* E. Create a datastore cluster:This is unrelated to managing VM access. Datastore clusters pertain to storage management and are not involved in user permissions or role assignments.

NEW QUESTION # 22

An administrator is tasked to create a new VMware vSAN cluster. The following information was provided to the administrator:

* Should host high performance application.

* Workload is latency dependent.

* Workload, compute and storage must be in the vSAN cluster.

Which configuration should the administrator choose for this vSAN cluster?

- A. vSAN Original Storage Architecture (OSA) Stretched Cluster
- B. vSAN Storage Cluster
- C. vSAN Original Storage Architecture (OSA)
- D. vSAN Express Storage Architecture (ESA)

Answer: D

Explanation:

The workload requirements specify:

* High-performance application

* Latency-dependent workloads

* Compute and storage must reside in the vSAN cluster

The correct option is vSAN Express Storage Architecture (ESA) because:

* ESA is designed for high-performance, low-latency applications.

* It leverages NVMe-based storage devices and 25GbE networking, delivering better IOPS and reduced latency compared to OSA.

* OSA (Original Storage Architecture) is older and less efficient.

* OSA Stretched Cluster (A) is for resilience across sites, not specifically performance.

* vSAN Storage Cluster (B) is a generic term and not specific.

NEW QUESTION # 23

Which scenario demonstrates the benefit of server consolidation using VMware server virtualization?

- **A. Running multiple independent machines on a single physical host.**
- B. Providing protection against ransomware attacks.
- C. Automating the deployment of application clusters.
- D. Performing load balancing between web servers.

Answer: A

Explanation:

The core benefit of server consolidation using VMware server virtualization is the ability to run multiple independent virtual machines (VMs) on a single physical host.

* This increases hardware utilization, reduces physical server sprawl, and cuts operational costs.

* A. Load balancing# Achieved through features like DRS, not basic server consolidation.

* C. Ransomware protection# Achieved through security features and backups, not consolidation.

* D. Automating application clusters# A benefit of orchestration tools, not consolidation.

NEW QUESTION # 24

In VMware Cloud Foundation (VCF) Operations for Logs, where does an administrator visualize the value range of a field?

- A. Click the pencil in the Manage Fields pane.
- B. Click on the field in the Field Table.
- **C. Click on the field in the Events table.**
- D. Click on the field in Manage Fields.

Answer: C

Explanation:

In VCF Operations for Logs, administrators can analyze logs using queries, fields, and charts. A key feature is the ability to view the value range of a specific field.

* When a log query is executed, results appear in the Events table.

* Each field shown in the Events table is interactive.

* By clicking on a field in the Events table, administrators can drill down into the data to visualize its value distribution (range), typically in the form of a histogram or grouped data set.

This provides insight into what values are present and how frequently they occur, which is useful for troubleshooting, anomaly detection, and refining queries.

Why not the other options?

* A. Click the pencil in the Manage Fields pane# Used to edit or extract fields, not visualize ranges.

* C. Click on the field in Manage Fields# Displays field definitions and settings, not real-time value ranges.

* D. Click on the field in the Field Table# The Field Table lists defined fields but does not provide value range visualization.

NEW QUESTION # 25

An administrator is tasked to configure VMware Cloud Foundation (VCF) Operations alerts to notify only relevant stakeholders when alerts trigger.

Which configuration step will satisfy the requirement?

- A. Configure notification to write a file to an output folder.
- **B. Configure notification to specific alert recipients.**
- C. Configure notification for only critical alerts.
- D. Configure notification to use generic contact information.

Answer: B

Explanation:

In VCF Operations, alerts can be configured with notification settings. To ensure only relevant stakeholders receive alerts:

- * You assign specific recipients to notifications.

- * This avoids alert fatigue and ensures teams only see alerts they are responsible for.

Other options:

- * A. Write to file# Not for stakeholder notifications.

- * B. Only critical alerts# Reduces volume, but still not targeted to relevant recipients.

- * D. Generic contact info# Sends to broad groups, not selective.
