ISACA Certified in the Governance of Enterprise IT Exam Sample Questions (Q503-Q508):

NEW QUESTION # 503

A regulatory audit assessed an enterprise's main transactional application as noncompliant. In addition to fines and required corrections, an agreement was reached to implement a set of governance controls over IT. Accountability for these controls is BEST assigned to which of the following?

- A. Application users
- **B. The board of directors**
- C. Internal audit director
- D. CIO

Answer: B

NEW QUESTION # 504

When deciding to develop a system with sensitive data, which of the following is MOST important to include in a business case?

- **A. The additional cost of encrypting sensitive data**
- B. Skills gap analysis
- C. Updated enterprise architecture (EA)
- D. A risk assessment to determine the appropriate controls

Answer: A

NEW QUESTION # 505

An enterprise's IT department has failed to deliver required solutions on time due to insufficient resource allocation, resulting in a longer time to market. Which of the following is the BEST way for the chief information officer (CIO) to address this situation?

- **A. Evaluate the availability and capacity planning process.**
- B. Benchmark IT staffing levels against similar organizations in the industry.
- C. Direct the project management office (PMO) to review and prioritize IT projects.
- D. Implement a new IT change management procedure.

Answer: A

Explanation:

The issue described in the question is the failure to deliver IT solutions on time due to insufficient resource allocation, which points to a problem in resource management, specifically in capacity and availability planning. According to the CGEIT Review Manual 8th Edition, effective IT resource management involves ensuring that IT resources (human, technological, and financial) are allocated efficiently to meet enterprise objectives. The manual emphasizes the importance of capacity planning to align resource availability with project demands, which directly addresses delays caused by resource shortages.

Extract from CGEIT Review Manual 8th Edition (Domain 2: IT Resources): "Capacity planning ensures that IT resources are sufficient to meet current and future business requirements in a cost-effective manner. It involves assessing the availability of resources, forecasting demand, and aligning resource allocation with strategic priorities to avoid bottlenecks and delays in delivery." (Approximate reference: Domain 2, Section on Resource Management) Evaluating the availability and capacity planning process (option B) is the most direct approach to identifying and resolving resource allocation issues. This process involves reviewing current resource utilization, forecasting future needs, and ensuring that resources are allocated to high-priority projects to reduce time-to-market delays.

Why not the other options?

A). Implement a new IT change management procedure: Change management procedures focus on controlling changes to IT systems and services, not on addressing resource allocation or capacity issues. This option is unrelated to the root cause of the

problem.

C). Benchmark IT staffing levels against similar organizations: While benchmarking can provide insights into staffing adequacy, it is a secondary step that does not directly address the immediate issue of resource allocation and capacity planning. It may be useful later but is not the first step.

D). Direct the PMO to review and prioritize IT projects: While project prioritization is important, it does not address the underlying issue of insufficient resource allocation. Prioritization may help focus efforts, but without adequate resources, delays will persist.

NEW QUESTION # 506

The GREATEST benefit associated with a decision to implement performance metrics for key IT assets is the ability to:

- A. determine the average cost of controls for protection of IT assets.
- **B. determine the contribution of IT assets in achievement of IT goals.**
- C. compare the performance of IT assets against industry best practices.
- D. establish the span of control during the life cycle of IT assets.

Answer: B

Explanation:

* This is because performance metrics are measurable values that indicate how well the IT assets are performing in terms of functionality, quality, efficiency, and effectiveness. By implementing performance metrics for key IT assets, the organization can:

* Monitor and review the IT assets' progress, performance, quality, and outcomes

* Highlight the IT assets' achievements, challenges, and opportunities

* Demonstrate the alignment of the IT assets with the IT strategy, goals, and priorities

* Provide recommendations and feedback for the IT assets' improvement and adjustment
Implementing performance metrics for key IT assets can help the organization determine the contribution of IT assets in achievement of IT goals, and ensure that they deliver value to the business.

The other options, establishing the span of control during the life cycle of IT assets, determining the average cost of controls for protection of IT assets, and comparing the performance of IT assets against industry best practices are not as beneficial as determining the contribution of IT assets in achievement of IT goals for implementing performance metrics for key IT assets. They are more related to specific aspects or outcomes of IT asset management, rather than a holistic and strategic benefit. They may also not be relevant or applicable to all types or categories of IT assets. They may not address the full scope or potential of IT asset improvement and optimization.
