In the recent few years, CompTIA CLO-002 exam certification have caused great impact to many people. But the key question for the future is that how to pass the CompTIA CLO-002 exam more effectively. The answer of this question is to use ExamCost's CompTIA CLO-002 Exam Training materials, and with it you can pass your exams. So what are you waiting for? Go to buy ExamCost's CompTIA CLO-002 exam training materials please, and with it you can get more things what you want.

The CLO-002 certification testifies that you have a deep understanding of the fundamental concepts of cloud computing, including migration, virtualization, security, governance, and compliance. It requires candidates to demonstrate their knowledge of cloud computing architectures, designing and deploying virtual infrastructure, and implementing best practices for cloud management. Moreover, you must have hands-on experience with cloud-based solutions to be eligible for the exam. Passing the CompTIA CLO-002 Certification is a clear indication that one has the required skills of handling cloud platforms, thus, making professionals highly sought after.

It is incontrovertible high quality and high accuracy CLO-002 practice materials that have helped more than 98 percent of exam candidates who choose our CLO-002 real quiz gets the certificate successfully. So we totally understand you inmost thoughts, and the desire to win the CLO-002 Exam as well as look forward to bright future that come along. During your practice process accompanied by our CLO-002 study guide, you will easily get the certificate you want.

CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q315-Q320):

NEW QUESTION # 315

A startup company wants to use a CRM application to manage its sales and support organizations. The company does not have any IT staff. Which of the following cloud computing models is MOST appropriate for this company to use?

- A. IaaS
- B. CaaS
- C. PaaS
- D. SaaS

Answer: D

Explanation:

SaaS stands for Software as a Service, which is a cloud computing model that provides ready-to-use software applications over the internet, such as CRM, email, or office suites. SaaS is the most appropriate cloud computing model for a startup company that wants to use a CRM application to manage its sales and support organizations, and does not have any IT staff. SaaS offers the following benefits for the company:

SaaS does not require any installation, maintenance, or update of the software, as the cloud provider handles all the technical aspects of the service. The company can access the software through a web browser or a mobile app, without worrying about the underlying infrastructure, platform, or software.

SaaS is scalable, flexible, and cost-effective, as the company can adjust the number of users or features of the software according to its needs and budget. The company only pays for what it uses, and can avoid the upfront costs of purchasing or licensing the software.

SaaS is reliable, secure, and compliant, as the cloud provider ensures the availability, backup, and recovery of the software, as well as the protection of the data and the adherence to the relevant standards and regulations.

NEW QUESTION # 316

Twitter is a service that allows users to exchange short text messages. This is an example of

- A. IaaS
- B. QoS
- C. PaaS
- D. SaaS

Answer: D

NEW QUESTION # 317

A cloud administrator wants to ensure nodes are added automatically when the load on a web cluster increases. Which of the following should be implemented?

- A. Autoscaling
- B. Infrastructure as code
- C. Autonomous systems
- D. Right-sizing

Answer: A

Explanation:

Autoscaling is a cloud computing feature that enables organizations to scale cloud services such as server capacities or virtual machines up or down automatically, based on defined situations such as traffic or utilization levels¹. Autoscaling helps to ensure that nodes are added automatically when the load on a web cluster increases, and removed when the load decreases, to optimize performance and costs. Autoscaling can be configured using built-in mechanisms or custom implementations, depending on the cloud service and the specific requirements².

Autonomous systems are networks that are administered by a single entity and have a common routing policy. Autonomous systems are not related to autoscaling, but rather to network connectivity and routing protocols.

Infrastructure as code is a practice of managing and provisioning cloud resources using code or scripts, rather than manual processes or graphical interfaces. Infrastructure as code can help to automate and standardize cloud deployments, but it does not necessarily imply autoscaling, unless the code or scripts include logic for scaling resources based on demand.

Right-sizing is a technique of optimizing cloud resources to match the actual needs and usage patterns of an application or service.

Right-sizing can help to reduce costs and improve efficiency, but it does not involve adding or removing nodes automatically based on load. Right-sizing is usually done periodically or on-demand, rather than continuously³.

NEW QUESTION # 318

Which of the following technologies would help a game company prepare its cloud infrastructure to support a global distribution workload of a newly released online game? (Choose two.)

- A. Auto-scaling
- B. VDI
- C. Blockchain

- D. Data portability
- E. Templates
- F. CDN

Answer: A,F

Explanation:

Auto-scaling and CDN are two technologies that would help a game company prepare its cloud infrastructure to support a global distribution workload of a newly released online game.

Auto-scaling is the ability of a cloud service to automatically adjust the amount of resources, such as compute, storage, or bandwidth, based on the demand or load of the service. Auto-scaling can help a game company to handle the spikes or fluctuations in the number of players or traffic that may occur during the launch or peak times of a new online game. Auto-scaling can also help the game company to optimize the performance, availability, and cost of the cloud service, as it can scale up or down the resources as needed. Auto-scaling can be triggered by predefined rules, metrics, or schedules, or by using machine learning or artificial intelligence to predict the demand patterns.¹² CDN stands for Content Delivery Network, which is a network of distributed servers that deliver content, such as web pages, images, videos, or games, to the end-users based on their geographic location, the origin of the content, and the network conditions. CDN can help a game company to distribute its online game to a global audience, as it can reduce the latency, bandwidth, and load on the origin server, and improve the user experience, security, and reliability of the content delivery. CDN can also help the game company to cope with the high volume of requests or traffic that may occur during the launch or peak times of a new online game. CDN can use various techniques, such as caching, compression, encryption, or load balancing, to optimize the content delivery.³⁴

NEW QUESTION # 319

For security reasons, a cloud service that can be accessed from anywhere would make BEST use of:

- A. multifactor authentication.
- B. replication.
- C. single sign-on.
- D. data locality

Answer: A
