2026 Useful Development-Lifecycle-and-Deployment-Architect: Salesforce Certified Development Lifecycle and Deployment Architect Reliable Exam Preparation

With Development-Lifecycle-and-Deployment-Architect exam dumps from ActualVCE, we provide guaranteed success rate for the Development-Lifecycle-and-Deployment-Architect. We provide latest and updated question answers for Development-Lifecycle-and-Deployment-Architect exam for preparation. You can prepare for the Development-Lifecycle-and-Deployment-Architect with our test products including Development-Lifecycle-and-Deployment-Architect PDF dumps questions, and test preparation software. You can prepare for the Development-Lifecycle-and-Deployment-Architect through practice kits without facing any problem. You can get the desired score for the Development-Lifecycle-and-Deployment-Architect and join the list of our satisfied customers. The Development-Lifecycle-and-Deployment-Architect test questions and preparation material is prepared by highly skilled certified professionals.

Salesforce Development-Lifecycle-and-Deployment-Architect Exam is a challenging exam that requires a deep understanding of Salesforce development and deployment. To prepare for the exam, professionals should have experience with the Salesforce platform and should be familiar with the tools and processes involved in the SDLC. They should also be familiar with the various deployment options available in Salesforce, including sandbox environments, change sets, and the Salesforce CLI.

Salesforce Certified Development Lifecycle and Deployment Architect

Sample Questions (Q28-Q33):

NEW QUESTION # 28

All AppExchange products are subject to Salesforce security reviews.

What is the most common reason that the prospect AppExchange products fail the security review?

- A. Session hacking
- B. CRUD/FLS (field level security)
- C. SOQL injection
- D. Cross-site scripting

Answer: D

Explanation:

Cross-site scripting is the most common reason that the prospect AppExchange products fail the security review. Cross-site scripting (XSS) is a type of web application vulnerability that allows an attacker to inject malicious code into a web page that is viewed by other users. XSS can compromise the security and privacy of the users, as well as the functionality and performance of the application. Salesforce has strict security standards and policies for AppExchange products, and any product that has XSS vulnerabilities will not pass the security review. CRUD/FLS, session hacking, and SOQL injection are also security issues that can affect AppExchange products, but they are not as common or severe as XSS.

NEW QUESTION # 29

Universal Containers wants to delete the day's test data in a partial copy sandbox every night, setting the sandbox back to a fresh state for tomorrow's testing. The test data is approximately 1GB.

What is the best strategy the architect should recommend?

- A. Manually delete all records individually.
- B. Refresh the sandbox every night.
- C. Execute a batch job that deletes all records created on the day.
- D. Create a new developer copy sandbox every night.

Answer: C

NEW QUESTION # 30

Universal Containers (UC) is embarking on a large program of work, with different projects and different vendors. UC created a center of excellence (COE) that is struggling with scope creep between the different projects.

What role should the architect suggest be added to the COE?

- A. Product owner
- B. Change managers
- C. Scrum master
- D. Release managers

Answer: A

Explanation:

A product owner is responsible for defining the scope and prioritizing the backlog of the project. A product owner can help the COE manage the scope creep between the different projects by aligning the business goals and ensuring the value delivery. A scrum master, a release manager, and a change manager are not directly involved in scope management.

NEW QUESTION # 31

Universal Containers is adopting Scrum as an agile methodology and wants to choose a software tool to support the adoption. What three key features of an agile development support tool should an architect look for? Choose 3 answers

- A. Work (for example, user stories or tasks) assignment
- B. Email notifications when work is created or changed

- C. Kanban board
- D. Product backlog prioritization
- E. Sprint backlog management

Answer: A,D,E

Explanation:

The key features of an agile development support tool that an architect should look for are sprint backlog management, product backlog prioritization, and work assignment. These features enable the team to plan, execute, and monitor the sprints effectively and efficiently. Email notifications and Kanban board are not essential features of an agile development support tool, as they can be achieved by other means or tools.

NEW QUESTION # 32

Universal Containers (UC) had been using change sets for deploying all of the modifications to its Sales Cloud apps. After multiple business units joined the single Salesforce instance, there is a need to evaluate which development model is the most suitable for UC. The IT management has shown a particular interest in finding out more about the package development model.

As an architect, which two statements can be made to articulate the differences between the change set model and package development model?

Choose 2 answers

- A. In change set development, the source of truth is a combination of the metadata already in the environment and the content of your change Set.
- B. In package development, the best practice is to consider the dependencies and build the dependencies into the package so it can be deployed in any other target orgs.
- C. A change set can be retrieved from the developer's workbench as a package, then pushed into the version control system to achieve the Versioning control.
- D. In package development, the source of truth is the metadata in the package project, which makes it easy to integrate to a version control System.

Answer: B,D

Explanation:

In the change set model, the source of truth is a combination of the metadata already in the environment and the content of your change set, as you stated correctly. However, a change set cannot be retrieved from the developer's workbench as a package, nor can it be pushed into the version control system. Change sets are only available within the Salesforce UI, and they are not compatible with version control systems. In the package development model, the source of truth is the metadata in the package project, which makes it easy to integrate to a version control system, as you stated correctly. Additionally, in the package development model, the best practice is to consider the dependencies and build them into the package so it can be deployed in any other target orgs. This ensures that the package is self-contained and does not rely on external components that may not exist in the target org.
