Introduction of CompTIA CAS-004 Exam

The CompTIA Advanced Security Practitioner exam is designed to validate a person's ability to configure and administer security policies on a stand-alone computer system or network. This means the person must be able to identify, analyze, and correct problems associated with security breaches. The candidate must also have the skills necessary to maintain the security of a stand-alone or networked computer system or data communication facility. If you are interested in the CompTIA CAS-004 Exam, this is the place for you! Here at **CompTIA CAS-004 exam dumps** we have taken great care to ensure that the questions and answers in our CompTIA CAS-004 braindumps are accurate and easy to understand. We guarantee that if you become addicted to our website, it will be because of the quality of our products and not because of any frustrating difficulty level.

There are a lot of students that bought BraindumpsVCE's CompTIA CAS-004 dumps and are satisfied with our services because they passed their CompTIA Certification Exams on the very first try. We assure you that if you study with our provided CompTIA CAS-004 Practice Questions, you can pass CompTIA Advanced Security Practitioner (CASP+) Exam (CAS-004) certification test in a single attempt, and if you fail to do it, you can claim your money back from us according to terms and conditions.

The CASP+ certification is ideal for those who have experience in the cybersecurity field and want to take their careers to the next level. It covers a wide range of topics, including risk management, enterprise security architecture, research, and collaboration, among others. CompTIA Advanced Security Practitioner (CASP+) Exam certification will help professionals demonstrate their ability to assess and mitigate risks, design secure solutions, and implement best practices to protect their organization's information assets.

CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q523-Q528):

NEW QUESTION # 523

A DNS forward lookup zone named complia.org must:

- * Ensure the DNS is protected from on-path attacks.
- * Ensure zone transfers use mutual authentication and are authenticated and negotiated.

Which of the following should the security architect configure to meet these requirements? (Select two).

- A. Public keys
- B. CNAME records

- C. DNSSEC
- D. Conditional forwarders
- E. Root hints
- F. SRV records

Answer: A,C

Explanation:

To protect DNS from on-path attacks and ensure that zone transfers are mutually authenticated and secure, the security architect should configure DNSSEC and Public keys. DNSSEC (Domain Name System Security Extensions) provides protection against DNS spoofing by digitally signing DNS data to ensure its integrity. Public keys are crucial for mutual authentication during zone transfers, ensuring that only authorized parties can exchange DNS zone data. Together, these options help meet both the requirements of securing DNS queries and authenticating zone transfers with cryptographic integrity.

NEW QUESTION # 524

Which of the following is the MOST important security objective when applying cryptography to control messages that tell an ICS how much electrical power to output?

- A. Assuring the integrity of messages
- B. Ensuring non-repudiation of messages
- C. Enforcing protocol conformance for messages
- D. Importing the availability of messages

Answer: A

Explanation:

Assuring the integrity of messages is the most important security objective when applying cryptography to control messages that tell an ICS (industrial control system) how much electrical power to output. Integrity is the security objective that ensures the accuracy and completeness of data or information, preventing unauthorized modifications or tampering. Assuring the integrity of messages can prevent malicious or accidental changes to the control messages that could affect the operation or safety of the ICS or the electrical power output. Importing the availability of messages is not a security objective when applying cryptography, but a security objective that ensures the accessibility and usability of data or information, preventing unauthorized denial or disruption of service. Ensuring non-repudiation of messages is not a security objective when applying cryptography, but a security objective that ensures the authenticity and accountability of data or information, preventing unauthorized denial or dispute of actions or transactions. Enforcing protocol conformance for messages is not a security objective when applying cryptography, but a security objective that ensures the compliance and consistency of data or information, preventing unauthorized deviations or violations of rules or standards. NEW QUESTION # 525

An organization is prioritizing efforts to remediate or mitigate risks identified during the latest assessment. For one of the risks, a full remediation was not possible, but the organization was able to successfully apply mitigations to reduce the likelihood of impact. Which of the following should the organization perform NEXT?

- A. Assess the residual risk.
- B. Recalculate the magnitude of impact.
- C. Update the organization's threat model.
- D. Move to the next risk in the register.

Answer: A

Explanation:

Assessing residual risk involves specifying a treatment percentage to define how much of the treatment reduces the inherent risk.

NEW QUESTION # 526

A security engineer needs to implement a cost-effective authentication scheme for a new web-based application that requires:

- * Rapid authentication
- * Flexible authorization
- * Ease of deployment
- * Low cost but high functionality

Which of the following approaches best meets these objectives?

- A. SAML
- B. Kerberos
- C. EAP
- D. TACACS+
- **E. OAuth**

Answer: E

Explanation:

OAuth, which stands for Open Authorization, is a standard for authorization that enables secure token-based access. It allows users to grant a web application access to their information on another web application without giving them the credentials for their account. OAuth is particularly useful for rapid authentication, flexible authorization, ease of deployment, and offers high functionality at a low cost, making it an ideal choice for new web-based applications. This approach is well-suited for situations where web applications need to interact with each other on behalf of the user, without sharing user's password, such as integrating a geolocation application with Facebook. OAuth uses tokens issued by an authorization server, providing restricted access to a user's data, which aligns with the objectives of rapid authentication, flexible authorization, ease of deployment, and cost-effectiveness.

NEW QUESTION # 527

Due to adverse events, a medium-sized corporation suffered a major operational disruption that caused its servers to crash and experience a major power outage. Which of the following should be created to prevent this type of issue in the future?

- A. SLA
- B. BIA
- C. BCP
- D. BCM
- **E. RTO**

Answer: E
