HPE Network Switching Associate Exam Sample Questions (Q37-Q42):

NEW QUESTION # 37

At which layer of the OSI model does data segmentation occur?

- A. Network Layer
- B. Data Link Layer
- C. Application Layer
- D. Transport Layer

Answer: D

Explanation:

The correct answer is B. Transport Layer. Data segmentation is a Transport Layer function. At Layer 4, protocols such as TCP divide application data into smaller pieces called segments so that data can be transported between endpoints. The Transport Layer

also uses TCP and UDP port numbers to identify application conversations between hosts. HPE Aruba Networking AOS-CX ACL documentation references TCP/UDP ports as Layer 4 ports, which aligns transport-layer port usage with the Transport Layer. The Application Layer provides user-facing application services, but it does not perform transport segmentation. The Network Layer handles logical IP addressing and routing. The Data Link Layer handles Ethernet framing, MAC addressing, and local delivery on a network segment. Therefore, when the question asks where data segmentation occurs in the OSI model, the correct answer is the Transport Layer. (arubanetworking.hpe.com)

NEW QUESTION # 38

Which two transport layer protocols operate at Layer 4? (Choose two.)

- A. ICMP
- B. IP
- C. TCP
- D. UDP

Answer: C,D

Explanation:

Both TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) operate at the Transport Layer (Layer 4) of the OSI model. These protocols are responsible for managing the end-to-end communication and flow of data between devices on a network.

A). TCP (Transmission Control Protocol): TCP is a connection-oriented protocol that provides reliable, ordered, and error-checked delivery of data between applications. It ensures that data packets are delivered correctly and in the correct order.

B). UDP (User Datagram Protocol): UDP is a connectionless protocol that does not guarantee reliable delivery or ordering of data packets. It is used in applications where speed is more important than reliability, such as streaming media or online gaming.

NEW QUESTION # 39

A network administrator is designing a network with a redundant path between two distribution switches. To prevent Layer 2 loops while allowing for fast failover, the administrator has enabled Rapid Spanning Tree Protocol (RSTP).

What is the primary advantage of using RSTP (802.1w) over the original Spanning Tree Protocol (STP, 802.1D)?

- A. RSTP allows all ports to forward traffic simultaneously by load balancing.
- B. RSTP significantly reduces the convergence time after a link failure.
- C. RSTP supports more VLANs than STP.
- D. RSTP uses a more secure method for electing the root bridge.

Answer: B

NEW QUESTION # 40

Which statement is true given the IP address 10.64.0.240 and subnet mask 255.255.254.0?

- A. There are more than 8 bits in the host portion.
- B. The prefix length of the network is /25.
- C. The network portion of the address is 10.64.
- D. 10.64.0.240 is a broadcast address.

Answer: A

Explanation:

The mask 255.255.254.0 corresponds to a /23 prefix, leaving 9 host bits. That means the host portion contains more than 8 bits.

NEW QUESTION # 41

A Network Operator needs to create a new subnet for a small department that requires exactly 12 usable IP addresses for its devices.

Which subnet mask or prefix length will provide the required number of usable host addresses with the least amount of wasted addresses?

- A. /29 (255.255.255.248)
- B. /26 (255.255.255.192)
- C. /28 (255.255.255.240)
- D. /27 (255.255.255.224)

Answer: C
