PCEP Practice Tests | PCEP-30-02 exam questions

Question #1

Free PCEP (PCEP-30-02) Practice Mock Exam
Topic: Section 3: Data Collections - Tuples, Dictionaries, Lists and Strings
What is the output of the following code?

```
str = \"***\"  
print(len(str))
```

Select any one of given answer:

Choice A: 5

Choice B: Error

Choice C: 3

Choice D: 1

PCEP Practice Tests | PCEP-30-02 exam questions

Question #2

Free PCEP (PCEP-30-02) Practice Mock Exam
Topic: Section 1: Common Programming and Python Fundamentals
What is the result of the following code?

P.S. Free & New PCEP-30-02 dumps are available on Google Drive shared by Getcertkey: https://drive.google.com/open?id=14eWwkCHU6Y_uUIAk96ru0304vHD_qzoQ

To fulfill our dream of helping our users get the PCEP-30-02 certification more efficiently, we are online to serve our customers 24 hours a day and 7 days a week. Therefore, whenever you have problems in studying our PCEP-30-02 test training, we are here for you. You can contact with us through e-mail or just send to our message online. And unlike many other customer service staff who have bad temper, our staff are gentle and patient enough for any of your problems in practicing our PCEP-30-02 study torrent. In addition, we have professional personnel to give you remote assistance on PCEP-30-02 exam questions.

The feedback collected was used to design our products through interviews with top PCEP - Certified Entry-Level Python Programmer PCEP-30-02 exam professionals. You are certain to see questions similar to the questions on this Python Institute PCEP-30-02 exam dumps on the main PCEP-30-02 Exam. All you have to do is select the right answer, which is already in the Python Institute PCEP-30-02 questions. PCEP - Certified Entry-Level Python Programmer PCEP-30-02 exam dumps have mock exams that give you real-life exam experience.

PCEP-30-02 Valid Test Vce Free | PCEP-30-02 Valid Test Practice

The content of our study materials is easy to be mastered and has simplified the important information. Our PCEP-30-02 test questions convey more important information with less questions and answers and thus make the learning relaxing and efficient. The

software boosts self-learning and self-assessment functions to check the results of the learning. The software can help the learners find the weak links and deal with them. Our PCEP-30-02 Test Questions boost timing function and the function to stimulate the exam. Our PCEP-30-02 exam materials have simplified the complicated notions and add the instances, the stimulation and the diagrams to explain any contents which are hard to explain. So you can enjoy the service of high quality and pass the exam successfully.

Python Institute PCEP-30-02 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Loops: while, for, range(), loops control, and nesting of loops.
Topic 2	<ul style="list-style-type: none"> Data Collections: In this section, the focus is on list construction, indexing, slicing, methods, and comprehensions; it covers Tuples, Dictionaries, and Strings.
Topic 3	<ul style="list-style-type: none"> parameters, arguments, and scopes. It also covers Recursion, Exception hierarchy, Exception handling, etc.
Topic 4	<ul style="list-style-type: none"> Control Flow: This section covers conditional statements such as if, if-else, if-elif, if-elif-else
Topic 5	<ul style="list-style-type: none"> Functions and Exceptions: This part of the exam covers the definition of function and invocation

Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q20-Q25):

NEW QUESTION # 20

Which of the following expressions evaluate to a non-zero result? (Select two answers.)

- A. $4 / 2 ** 3 - 2$
- B. $2 ** 3 / A - 2$
- C. $1 * 4 // 2 ** 3$
- D. $1 ** 3 / 4 - 1$

Answer: A,B

Explanation:

Explanation

In Python, the `**` operator is used for exponentiation, the `/` operator is used for floating-point division, and the `//` operator is used for integer division. The order of operations is parentheses, exponentiation, multiplication/division, and addition/subtraction. Therefore, the expressions can be evaluated as follows:

A). $2 ** 3 / A - 2 = 8 / A - 2$ (assuming A is a variable that is not zero or undefined)

B). $4 / 2 ** 3 - 2 = 4 / 8 - 2 = 0.5 - 2 = -1.5$ C). $1 * ** 3 / 4 - 1 = 1 / 4 - 1 = 0.25 - 1 = -0.75$ D). $1 * 4 // 2 ** 3 = 4 // 8 = 0$ Only expressions A and B evaluate to non-zero results.

NEW QUESTION # 21

Arrange the code boxes in the correct positions to form a conditional instruction which guarantees that a certain statement is executed when the speed variable is less than 50.0.

Answer:

Explanation:

Explanation:

One possible way to arrange the code boxes in the correct positions to form a conditional instruction which guarantees that a certain statement is executed when the speed variable is less than 50.0 is:

```
if speed < 50.0:
    print("The speed is low.")
```

This code uses the `if` keyword to create a conditional statement that checks the value of the variable `speed`. If the value is less than 50.0, then the code will print "The speed is low." to the screen. The `print` function is used to display the output. The code is indented to show the block of code that belongs to the `if` condition.

You can find more information about the `if` statement and the `print` function in Python in the following references:

- * Python If... Else
- * Python Print Function

NEW QUESTION # 22

How many hashes (+) does the code output to the screen?

- A. three
- B. one
- C. five

- D. zero (the code outputs nothing)

Answer: C

Explanation:

Explanation

The code snippet that you have sent is a loop that checks if a variable "floor" is less than or equal to 0 and prints a string accordingly.

The code is as follows:

```
floor = 5 while floor > 0: print("+") floor = floor - 1
```

The code starts with assigning the value 5 to the variable "floor". Then, it enters a while loop that repeats as long as the condition "floor > 0" is true. Inside the loop, the code prints a "+" symbol to the screen, and then subtracts 1 from the value of "floor". The loop ends when "floor" becomes 0 or negative, and the code exits.

The code outputs five "+" symbols to the screen, one for each iteration of the loop. Therefore, the correct answer is C. five.

NEW QUESTION # 23

What happens when the user runs the following code?

```
total = 0
for i in range(4):
    if 2 * i < 4:
        total += 1
    else:
        total += 1
print(total)
```

- A. The code outputs 2.
- B. The code outputs 3.
- C. The code enters an infinite loop.
- D. The code outputs 1.

Answer: A

Explanation:

Explanation

The code snippet that you have sent is calculating the value of a variable "total" based on the values in the range of 0 to 3. The code is as follows:

```
total = 0 for i in range(0, 3): if i % 2 == 0: total = total + 1 else: total = total + 2 print(total)
```

The code starts with assigning the value 0 to the variable "total". Then, it enters a for loop that iterates over the values 0, 1, and 2 (the range function excludes the upper bound). Inside the loop, the code checks if the current value of "i" is even or odd using the modulo operator (%). If "i" is even, the code adds 1 to the value of

"total". If "i" is odd, the code adds 2 to the value of "total". The loop ends when "i" reaches 3, and the code prints the final value of "total" to the screen.

The code outputs 2 to the screen, because the value of "total" changes as follows:

When i = 0, total = 0 + 1 = 1

When i = 1, total = 1 + 2 = 3

When i = 2, total = 3 + 1 = 4

When i = 3, the loop ends and total = 4 is printed

Therefore, the correct answer is B. The code outputs 2.

NEW QUESTION # 24

Insert the code boxes in the correct positions in order to build a line of code which asks the user for an Integer value and assigns it to the counter variable.

(Note: some code boxes will not be used.)

Answer:

Explanation:

NEW QUESTION # 25
