A good job can create the discovery of more spacious space for us, in the process of looking for a job, we will find that, get the test Deep-Security-Professional certification, acquire the qualification of as much as possible to our employment effect is significant. Your life can be changed by our Deep-Security-Professional Exam Questions. Numerous grateful feedbacks from our loyal customers proved that we are the most popular vendor in this field to offer our Deep-Security-Professional preparation questions. You can totally rely on us.

Trend Deep-Security-Professional Exam covers a range of topics related to the Deep Security product, including installation, configuration, and management. Deep-Security-Professional exam also tests candidates' knowledge of security best practices, threat detection and response, and compliance requirements. Candidates who pass the exam earn the title of Trend Micro Certified Professional for Deep Security, which demonstrates their expertise in the field of cybersecurity.

## Trend Deep-Security-Professional Latest Test Online - Deep-Security-Professional Free Download

Deep-Security-Professional questions & answers cover all the key points of the real test. With the Deep-Security-Professional training pdf, you can get the knowledge you want in the actual test, so you do not need any other study material. If the Deep-Security-Professional exam is coming and the time is tense, it is better to choose our Deep-Security-Professional Test Engine dumps. Deep-Security-Professional test engine can simulate the actual test during the preparation and record the wrong questions for our reviewing. You just need 20-30 hours for preparation and feel confident to face the Deep-Security-Professional actual test.

## Trend Micro Certified Professional for Deep Security Sample Questions (Q52-Q57):

### NEW QUESTION # 52

Which of the following is NOT an operation that can be performed on Deep Security resources using the API?

- A. POST
- B. VIEW

- C. PUT
- D. GET

**Answer: B**

Explanation:

Trend Micro Deep Security APIs use standard RESTful operations:

GET (retrieve resource)

POST (create resource)

PUT (update resource)

DELETE (remove resource)

"VIEW" is not a standard HTTP method nor an operation in the Deep Security API context.

From the official documentation:

"The Deep Security API supports standard HTTP methods for interacting with resources: GET, POST, PUT, and DELETE."

### NEW QUESTION # 53

Based on the Malware Scan Configuration displayed in the exhibit, which of the following statements is false.

□

- A. Deep Security Agents will only be able to identify malware in files by using patterns downloaded from the Smart Protection Network.
- B. Any document files that display suspicious behavior will be submitted and executed in a sandbox environment on a Deep Discover Analyzer device.
- C. Internet access is required to properly enable the features identified in this configuration.
- **D. Deep Security Agents using this Malware Scan Configuration will not monitor for compromised Windows processes.**

**Answer: D**

Explanation:

Configure Malware Scan

### NEW QUESTION # 54

The "Protection Source when in Combined Mode" settings are configured for a virtual machine as in the exhibit. You would like to enable Application Control on this virtual machine, but there is no corresponding setting displayed. Why?

□

- **A. These settings are used when both a host-based agent and agentless protection are available for the virtual machine. Since Application Control is not supported in agentless installations, there is no need for the setting.**
- B. In the example displayed in the exhibit, the VMware Guest Introspection Service has not yet been installed. This service is required to enable Application Control in agentless installations.
- C. In the example displayed in the exhibit, the Application Control Protection Module has not yet been enabled. Once it is enabled for this virtual machine, the corresponding settings are displayed.
- D. In the example displayed in the exhibit, no activation code was entered for Application Control. Since the Protection Module is not licensed, the corresponding settings are not displayed.

**Answer: A**

Explanation:

The "Protection Source when in Combined Mode" configuration appears only for features supported in both agent-based and agentless (VMware NSX) modes.

Application Control is not available in agentless installations-it is only supported with host-based (agent) deployment. Therefore, there is no setting for Application Control in this combined mode view, as agentless protection cannot provide this module.

Options A and C are not correct-licensing and module enablement are not the reason for the absence here; it is due to module capability in agentless mode.

Option D is incorrect-VMware Guest Introspection is not relevant to Application Control's availability.

### NEW QUESTION # 55

Which of the following are valid methods for pre-approving software updates to prevent Application Control Events from being triggered by the execution of the modified software? Select all that apply.

- A. Software updates performed by a Trusted Updater will be automatically approved.
- B. Maintenance mode can be enabled while completing the updates.
- C. Edit the inventory database file (AC.db) on the Agent computer to include the hash of the newly updated software. Save the change and restart the Deep Security Agent. The software updates will now be approved.
- D. Once the inventory scan has run when Application Control is first enabled, there is no way to update the inventory to incorporate modified software.

**Answer: A,B**

Explanation:

Application Control can be configured to pre-approve updates either by performing them with a designated Trusted Updater (such as a software management tool or patch process) or by putting the agent in Maintenance Mode, during which changes are automatically approved. Manually editing the AC.db file is not a supported or recommended method.

### NEW QUESTION # 56

Which of following statements best describes Machine Learning in Deep Security?

- A. Machine Learning is malware detection technique in which processes on the protected computer are monitored for actions that are not typically performed by a given process.
- B. Machine Learning is a malware detection technique in which files are scanned based on the true file type as determined by the file content, not the extension.
- C. Machine Learning is a malware detection technique in which the Deep Security Agent monitors process memory in real time and once a process is deemed to be suspicious, Deep Security will perform additional checks with the Smart Protection Network to determine if this is a known good process.
- D. Machine Learning is malware detection technique in which features of an executable file are compared against a cloud-based learning model to determine the probability of the file being malware.

**Answer: D**

Explanation:

Machine Learning in Trend Micro Deep Security analyzes files by extracting a set of features from an executable file and comparing those features against a cloud-based machine learning model. This allows the system to determine the probability that the file is malware before it is allowed to execute, providing advanced protection even for previously unknown threats. This process is distinct from scanning based on file type, behavioral monitoring, or process monitoring.
