After paying our HPE6-A85 exam torrent successfully, buyers will receive the mails sent by our system in 5-10 minutes. Then candidates can open the links to log in and use our HPE6-A85 test torrent to learn immediately. Because the time is of paramount importance to the examinee, everyone hope they can learn efficiently. So candidates can use our HPE6-A85 guide questions immediately after their purchase is the great advantage of our product. The language is easy to be understood makes any learners have no obstacles. The HPE6-A85 Test Torrent is suitable for anybody no matter he or she is in-service staff or the student, the novice or the experience people who have worked for years. The software boosts varied self-learning and self-assessment functions to check the results of the learning.

HP HPE6-A85 (Aruba Campus Access Associate) Exam is designed to validate the skills and knowledge required by IT professionals who work with Aruba wireless technologies. Aruba Campus Access Associate Exam certification assesses the technical proficiency of candidates in configuring and troubleshooting Aruba Wireless Local Area Networks (WLANs) and managing network infrastructure. The HP HPE6-A85 (Aruba Campus Access Associate) Exam objectives include mapping WLAN requirements to an Aruba architecture, configuring Aruba WLANs based upon the AP and controller capabilities, performing troubleshoot of common WLAN problems, and optimizing WLAN performance.

HP HPE6-A85 (Aruba Campus Access Associate) Certification Exam is a globally recognized certification that tests the knowledge and skills of network professionals in configuring and managing enterprise-level wireless networks. It covers a wide range of topics

related to wireless networking and requires in-depth knowledge and hands-on experience with wireless networking technologies. Aruba Campus Access Associate Exam certification is an essential certification for professionals who are looking to advance their careers in wireless networking and offers a competitive edge to certified professionals.

New HPE6-A85 Test Objectives, Advanced HPE6-A85 Testing Engine

Candidates who don't find actual HPE6-A85 Questions remain unsuccessful in the Aruba Campus Access Associate Exam (HPE6-A85) test and lose their resources. That's why Pass4suresVCE is offering real HP HPE6-A85 Questions that are real and can save you from wasting time and money. Hundreds of applicants have studied successfully from our HPE6-A85 latest questions in one go.

HP HPE6-A85 (Aruba Campus Access Associate) Certification Exam is an important certification for IT professionals who want to demonstrate their expertise in Aruba wireless networking. Aruba Campus Access Associate Exam certification exam covers a wide range of topics related to Aruba wireless networking and is designed to test the skills and knowledge of IT professionals in this area. Passing HPE6-A85 Exam is an excellent way for IT professionals to advance their careers and gain recognition within the industry.

HP Aruba Campus Access Associate Exam Sample Questions (Q39-Q44):

NEW QUESTION # 39

Based on the given topology, what is the requirement on an Aruba switch to enable LLDP messages to be received by Switch 1 port 1/1/24.

When Router 1 is enabled with LLDP?

- A. int 1/1/24, lldp receive
- **B. LLDP is enabled by default**
- C. int 1/1/24, no cdp
- D. global configuration lldp enable

Answer: B

Explanation:

For an Aruba switch to receive LLDP messages on a specific port, LLDP must be enabled on that port.

The default configuration for Aruba switches typically has LLDP enabled on all ports, so in most cases, no additional configuration is required.

This means that if Router 1 is sending LLDP messages, Switch 1 port 1/1/24 should receive them without additional configuration, as long as LLDP has not been disabled on that port. If LLDP were disabled on the switch or on the specific port, you would then need to enable it, which could be similar to option C (with correct Aruba OS syntax), as option B suggests a global configuration command which is not typically how LLDP is enabled on Aruba switches. Option D is related to Cisco Discovery Protocol (CDP), which is not relevant to LLDP operation.

NEW QUESTION # 40

A network technician has successfully connected to the employee SSID via 802.1X Which RADIUS message should you look for to ensure a successful connection?

- **A. Access-Accept**
- B. Authorized
- C. Success
- D. Authenticated

Answer: A

Explanation:

Explanation

The RADIUS message that you should look for to ensure a successful connection via 802.1X is Access-Accept. This message indicates that the RADIUS server has authenticated and authorized the supplicant (the device that wants to access the network) and has granted it access to the network resources. The Access-Accept message may also contain additional attributes such as VLAN ID, session timeout, or filter ID that specify how the authenticator (the device that controls access to the network, such as a switch) should treat the supplicant's traffic.

The other options are not RADIUS messages because:

Authorized: This is not a RADIUS message, but a state that indicates that a port on an authenticator is allowed to pass traffic from a supplicant after successful authentication and authorization.

Success: This is not a RADIUS message, but a status that indicates that an EAP Extensible Authentication Protocol (EAP) is an authentication framework that provides support for multiple authentication methods, such as passwords, certificates, tokens, or biometrics. EAP is used in wireless networks and point-to-point connections to provide secure authentication between a supplicant (a device that wants to access the network) and an authentication server (a device that verifies the credentials of the supplicant). exchange has completed successfully between a supplicant and an authentication server.

Authenticated: This is not a RADIUS message, but a state that indicates that a port on an authenticator has received an EAP-Success message from an authentication server after successful authentication of a supplicant.

NEW QUESTION # 41

You have physical access to an Aruba CX-Switch with unknown/lost credentials.

What are the possible steps to rebuild the credentials? (Select two.)

- A. Connect the switch via the console. Then, power cycle the switch.
- B. Call Aruba support for a one-time password.
- C. Use boot profile 0.
- D. Press and hold the clear button. Then, press the reset button for 2 seconds and release both buttons.
- E. Press and hold the clear button. Then, power-cycle the switch.

Answer: C,E

Explanation:

To regain access to an Aruba CX switch when credentials are unknown or lost, one can press and hold the clear button, then power cycle the switch to reset the password. Additionally, using the boot profile 0 at the boot loader menu can be used to bypass the current startup configuration, which may include the unknown credentials.

NEW QUESTION # 42

The noise floor measures 000000001 milliwatts, and the receiver's signal strength is -65dBm. What is the Signal to Noise Ratio?

- A. 35 dBm
- B. 45 dBm
- C. 15 dBm
- D. 25 dBm

Answer: D

Explanation:

The signal to noise ratio (SNR) is a measure that compares the level of a desired signal to the level of background noise. SNR is defined as the ratio of signal power to the noise power, often expressed in decibels (dB). A high SNR means that the signal is clear and easy to detect or interpret, while a low SNR means that the signal is corrupted or obscured by noise and may be difficult to distinguish or recover. To calculate the SNR in dB, we can use the following formula:

$$\text{SNR (dB)} = \text{Signal power (dBm)} - \text{Noise power (dBm)}$$

In this question, we are given that the noise floor measures -90 dBm (0.000000001 milliwatts) and the receiver's signal strength is -65 dBm (0.000316 milliwatts). Therefore, we can plug these values into the formula and get:

$$\text{SNR (dB)} = -65 \text{ dBm} - (-90 \text{ dBm})$$
$$\text{SNR (dB)} = -65 \text{ dBm} + 90 \text{ dBm}$$
$$\text{SNR (dB)} = 25 \text{ dBm}$$

Therefore, the correct answer is that the SNR is 25 dBm.

NEW QUESTION # 43

A network technician at a branch office is connecting VoIP phones to a newly configured AOS-CX switch.

Users are complaining that voice quality is not as good as at the corporate office. Further investigation shows the local-priority value at the branch office is 1 while at the corporate office is 5.

What describes the issue regarding the default QoS behavior on the AOS-CX switch?

- A. The QoS trust is set to none by default, and each VoIP phone's local priority is configured for CoS map entry 0.
- B. The QoS trust is set to none by default, and each VoIP phone's local priority is configured for CoS map entry 1.
- C. The QoS trust is set to CoS by default, and the VoIP phone's local-priority value is mapped to 1.
- D. The QoS trust is set to DSCP by default, and the VoIP phone's local-priority value is mapped to 1.

Answer: B

Explanation:

In an AOS-CX switch, if the QoS trust mode is not configured, it is set to none by default. The VoIP phones will mark their traffic with a local-priority value, which, if the QoS trust mode is none, will correspond to CoS map entry 1 by default. The local-priority value of 1 at the branch office likely indicates that the traffic is not being prioritized correctly compared to the corporate office, where a local-priority of 5 suggests a higher level of prioritization for voice traffic.
