Salesforce Certified MuleSoft Platform Architect Sample Questions (Q45-Q50):

NEW QUESTION # 45

An API has been updated in Anypoint Exchange by its API producer from version 3.1.1 to 3.2.0 following accepted semantic versioning practices and the changes have been communicated via the API's public portal.

The API endpoint does NOT change in the new version.

How should the developer of an API client respond to this change?

- A. The API producer should be contacted to understand the change to existing functionality
- B. The update should be identified as a project risk and full regression testing of the functionality that uses this API should be run
- **C. The API client code ONLY needs to be changed if it needs to take advantage of new features**
- D. The API producer should be requested to run the old version in parallel with the new one

Answer: C

NEW QUESTION # 46

Which of the following sequence is correct?

- A. API Client implements logic to call an API >> API Consumer requests access to API >> API routes the request to >> API Implementation
- B. API Consumer implements logic to call an API >> API Client requests access to API >> API Implementation routes the request to >> API
- **C. API Consumer requests access to API >> API Client implements logic to call an API >> API routes the request to >> API Implementation**
- D. API Client implements logic to call an API >> API Consumer requests access to API >> API Implementation routes the request to >> API

Answer: C

Explanation:

Correct Answer: API Consumer requests access to API >> API Client implements logic to call an API >> API routes the request to >> API Implementation

>> API consumer does not implement any logic to invoke APIs. It is just a role. So, the option stating "API Consumer implements logic to call an API" is INVALID.

>> API Implementation does not route any requests. It is a final piece of logic where functionality of target systems is exposed. So, the requests should be routed to the API implementation by some other entity. So, the options stating "API Implementation routes the request to >> API" is INVALID

>> The statements in one of the options are correct but sequence is wrong. The sequence is given as "API Client implements logic to call an API >> API Consumer requests access to API >> API routes the request to >> API Implementation". Here, the statements in the options are VALID but sequence is WRONG.

>> Right option and sequence is the one where API consumer first requests access to API on Anypoint Exchange and obtains client credentials. API client then writes logic to call an API by using the access client credentials requested by API consumer and the requests will be routed to API implementation via the API which is managed by API Manager.

NEW QUESTION # 47

A team is planning to enhance an Experience API specification, and they are following API-led connectivity design principles. What is their motivation for enhancing the API?

- A. The primary API consumer wants certain kinds of endpoints changed from the Center for Enablement standard to the consumer system standard
- **B. A Canonical Data Model is being adopted that impacts several types of data included in the API**
- C. An IP Allowlist policy is being added to the API instances in the Development and Staging environments
- D. The underlying System API is updated to provide more detailed data for several heavily used resources

Answer: B

Explanation:

In API-led design, an Experience API is enhanced to improve how data is delivered to end-user applications. One primary reason to enhance an Experience API is when new data standards, such as a Canonical Data Model, are adopted. Here's why:

Canonical Data Model (CDM):

Adopting a CDM standardizes data representations across the organization, making APIs more consistent and easier to consume across various services and applications.

Updating the Experience API ensures that it delivers data in this standardized format, improving interoperability and reusability. of Correct Answer (D):

A CDM impacts the structure and types of data the API provides, and this update would be directly relevant to an Experience API, as it is the primary point of interaction for applications.

of Incorrect Options:

Option A involves adapting to consumer-specific standards, which is against API-led design principles.

Option B involves changes in System APIs, which don't directly mandate changes to the Experience API unless data formatting adjustments are required.

Option C (IP Allowlist) relates to security rather than API design and would not motivate a functional enhancement of the API.

Reference

For more details on the use of Canonical Data Models in API-led architecture, refer to MuleSoft's guidelines on data standardization and Experience API best practices.

NEW QUESTION # 48

How can the application of a rate limiting API policy be accurately reflected in the RAML definition of an API?

- A. By refining the response definitions by adding the x-ratelimit-* response headers with description, type, and example
- B. By refining the request definitions by adding a remaining Requests query parameter with description, type, and example
- C. By refining the response definitions by adding the out-of-the-box Anypoint Platform rate-limit-enforcement securityScheme with description, type, and example
- D. By refining the resource definitions by adding a description of the rate limiting policy behavior

Answer: A

Explanation:

Correct Answer: By refining the response definitions by adding the x-ratelimit-* response headers with description, type, and example

NEW QUESTION # 49

An Order API must be designed that contains significant amounts of integration logic and involves the invocation of the Product API. The power relationship between Order API and Product API is one of "Customer/Supplier", because the Product API is used heavily throughout the organization and is developed by a dedicated development team located in the office of the CTO.

What strategy should be used to deal with the API data model of the Product API within the Order API?

- A. Convince the development team of the Product API to adopt the API data model of the Order API such that the integration logic of the Order API can work with one consistent internal data model
- B. Implement an anti-corruption layer in the Order API that transforms the Product API data model into internal data types of the Order API
- C. Start an organization-wide data modeling initiative that will result in an Enterprise Data Model that will then be used in both the Product API and the Order API
- D. Work with the API data types of the Product API directly when implementing the integration logic of the Order API such that the Order API uses the same (unchanged) data types as the Product API

Answer: B

Explanation:

Correct Answer: Convince the development team of the product API to adopt the API data model of the Order API such that integration logic of the Order API can work with one consistent internal data model

Key details to note from the given scenario:

>> Power relationship between Order API and Product API is customer/supplier So, as per below rules of "Power Relationships", the caller (in this case Order API) would request for features to the called (Product API team) and the Product API team would

need to accommodate those requests.
