C-SEC-2405 Upgrade Dumps, C-SEC-2405 Customizable Exam Mode

Professional ability is very important both for the students and for the in-service staff because it proves their practical ability in the area they major in. Therefore choosing a certificate exam which boosts great values to attend is extremely important for them and the test C-SEC-2405 Certification is one of them. Passing the test certification can prove your outstanding major ability in some area and if you want to pass the test smoothly you'd better buy our C-SEC-2405 study materials.

SAP Certified Associate - Security Administrator Sample Questions (Q34-Q39):

NEW QUESTION # 34

What must you do if you want to enforce an additional authorization check when a user starts an SAP transaction?

- A. Assign the authorization object to be checked to the chosen transaction code in the SAP Default authorization data using transaction SU22 and set Check Indicator to "Check".
- B. Assign authorization object S_START to the chosen transaction code with transaction SU24 and specify the Program ID and Object Type.
- C. Assign the authorization object and permissions to the chosen transaction code using transaction SE93.

- D. Assign the authorization object to be checked to the chosen transaction code with transaction SU24 and set Default Status to "Yes".

Answer: B

Explanation:

To enforce an additional authorization check when a user starts an SAP transaction, you need to assign the specific authorization object to the transaction code. This ensures that the system performs an extra check against the user's authorizations before allowing access to the transaction.

* Use Transaction SU24:

* SU24 is the transaction used to maintain authorization default data for transactions and other executables. It allows you to assign authorization objects to transactions and set the check indicators.

* Assign Authorization Object S_START:

* Authorization Object S_START is used to control the start of transactions. By assigning this object to a transaction code, you can specify additional checks based on the Program ID and Object Type.

* In SU24, navigate to the desired transaction code and add S_START to its list of authorization objects.

* Specify Program ID and Object Type:

* Within the authorization object S_START, set the Program ID and Object Type fields to define the scope of the check.

* This setup ensures that when a user attempts to start the transaction, the system checks for the specified authorizations in their user profile.

SAP Security References:

* SAP Help Portal: Authorization Checks and SU24 Maintenance

* SAP Documentation: Using Authorization Object S_START for Transaction Start Checks

* SAP Note: Best Practices for Maintaining Authorization Data with SU24

NEW QUESTION # 35

Where can you find information on the SAP-delivered default authorization object and value assignments?

Note: There are 2 correct answers to this question.

- A. SU22
- B. USOBT_C
- C. USOBT
- D. SU24

Answer: A,C

Explanation:

Information on SAP-delivered default authorization objects and their value assignments can be found in:

* USOBT (B):

* USOBT is a table that contains SAP's default check indicators and authorization object assignments for transactions.

* It holds the relationships between transaction codes and the authorization objects checked during transaction execution.

* SU22 (C):

* Transaction SU22 displays the SAP default authorization data.

* It allows administrators to view the standard authorization objects and field values that SAP assigns to transactions.

Note:

* USOBT_C is the customer version of the USOBT table, containing customer-specific modifications.

However, for SAP-delivered defaults, USOBT is the correct source.

* SU24 is used for maintaining customer-specific authorization data, not for viewing SAP defaults.

SAP Security References:

* SAP Help Portal: Understanding Authorization Object Tables (USOBT and USOBT_C)

* SAP Documentation: Using SU22 for Default Authorization Data

* SAP Note: Managing Authorization Checks with SU22 and SU24

NEW QUESTION # 36

When you maintain authorizations for SAPUI5 Fiori apps, which of the following object types is the front-end authorization object type?

- A. TADIR G4BA - SAP Gateway Odata V4 Backend Service Group & Assignments
- B. TADIR IWSG - SAP Gateway: Service Groups Metadata

- C. TADIR IWSV - SAP Gateway Business Suite Enablement-Service
- D. TADIR INA1 - InA Service

Answer: C

Explanation:

For SAPUI5 Fiori apps, the front-end authorization object type is TADIR IWSV (SAP Gateway Business Suite Enablement-Service). This object type represents the OData services used by Fiori apps on the front-end server, and its authorization is managed via the S_SERVICE authorization object in PFCG roles. The IWSV type specifically defines the services that the front-end server calls to access back-end data, requiring start authorizations and default values to be included in the role. TADIR IWSG is used for service group metadata, not front-end authorizations, and TADIR G4BA pertains to OData V4 services, which are less common in standard SAPUI5 Fiori apps. TADIR INA1 is related to InA (Information Access) services, not typical Fiori app authorizations. By using IWSV, SAP ensures that front-end authorizations are correctly aligned with the OData services powering Fiori apps, providing secure and efficient access control in SAP S/4HANA systems.

NEW QUESTION # 37

In the administration console of the Cloud Identity Services, for which system type can you define both read and write transformations?

- A. Source systems
- B. Target systems
- C. Proxy systems

Answer: B
