# CompTIA Network+ Certification Exam Sample Questions (Q138-Q143):

**NEW QUESTION # 138**
After installing a series of Cat 8 keystones, a data center architect notices higher than normal interference during tests. Which of the following steps should the architect take to troubleshoot the issue?

- A. Use passthrough modular crimping plugs instead of traditional crimping plugs.
- B. Connect the RX/TX wires to different pins.
- C. Run a speed test on a device that can only achieve 100Mbps speeds.
- D. Check to see if the end connections were wrapped in copper tape before terminating.

**Answer: D**

Explanation:
* Importance of Proper Termination:
* Cat 8 cabling requires precise termination practices to ensure signal integrity and reduce interference. One common requirement is to wrap the end connections in copper tape to maintain shielding and reduce electromagnetic interference (EMI).
* Interference Troubleshooting:
* Interference in high-frequency cables like Cat 8 can be caused by improper shielding or grounding. Checking the end connections for proper wrapping in copper tape is a crucial step.
* Why Other Options are Less Likely:
* Passthrough modular crimping plugs: Not specifically related to interference issues and are typically used for ease of cable assembly.
* Connecting RX/TX wires to different pins: Would likely result in no connection or incorrect data transmission rather than interference.
* Running a speed test on a device that can only achieve 100Mbps speeds: This would not diagnose interference and would not provide relevant information for Cat 8 cabling rated for
* higher speeds.
* Corrective Actions:
* Verify that all end connections are properly wrapped with copper tape before termination.
* Ensure that the shielding is continuous and properly grounded throughout the installation.
* Retest the cabling for interference after making corrections.

**NEW QUESTION # 139**
You have been tasked with implementing an ACL on the router that will:
1. Permit the most commonly used secure remote access technologies from the management network to all other local network segments
2. Ensure the user subnet cannot use the most commonly used remote access technologies in the Linux and Windows Server segments.
3. Prohibit any traffic that has not been specifically allowed.
INSTRUCTIONS
Use the drop-downs to complete the ACL

**NEW QUESTION # 140**
A network engineer is installing new PoE wireless APs. The first five APs deploy successfully, but the sixth one fails to start. Which of the following should the engineer investigate first?

- A. Power budget
- B. Duplex mismatch

- C. Signal strength
- D. CRC

**Answer: A**

Explanation:
When deploying multiple Power over Ethernet (PoE) devices, the switch's power budget can be exhausted. If the available wattage on the switch cannot supply the additional AP, it will fail to power on. This is the most likely cause when previous APs worked fine but a new one does not.
A). Signal strength affects wireless connectivity, not whether the AP powers up.
B). Duplex mismatch causes poor throughput, not power failure.
D). CRC errors point to cabling issues but do not prevent booting if no power is available.

# NEW QUESTION # 141
A network requirement calls for the network traffic of a specific department within a campus network to be monitored. The network has users from each department located in multiple buildings. Which of the following should be configured to meet this requirement? (Choose two.)

- A. MDIX
- B. Jumbo frames
- C. LACP
- D. Flow control
- E. 802.1Q
- F. Port mirroring

**Answer: E,F**

Explanation:
802.1Q is a standard for VLAN tagging, which allows the network administrator to segment the network traffic of different departments into separate VLANs. This makes it easier to monitor and manage the traffic of each department.
Port mirroring is a feature that allows the network administrator to copy the traffic from one or more ports to another port for analysis. By configuring port mirroring on the ports connected to the specific department, the network administrator can monitor the traffic of that department in real-time.

# NEW QUESTION # 142
Which of the following provides an opportunity for an on-path attack?

- A. Evil twin
- B. Phishing
- C. Dumpster diving
- D. Tailgating

**Answer: A**

Explanation:
An evil twin is a rogue Wi-Fi access point that mimics a legitimate network. Attackers use it to intercept and manipulate traffic, making it an on-path (formerly MITM) attack opportunity.
Breakdown of Options:
* A. Phishing - Tries to steal credentials through fake emails/websites but does not intercept network traffic.
* B. Dumpster diving - Involves physical security breaches, not network interception.
* C. Evil twin - #Correct answer. A rogue Wi-Fi AP impersonates a real network, allowing traffic interception.
* D. Tailgating - Involves physical access security, not network interception.

We try our best to provide the most efficient and intuitive learning methods to the learners and help them learn efficiently. Our N10-009 study materials provide the instances, simulation and diagrams to the clients so as to they can understand them intuitively. Based on the consideration that there are some hard-to-understand contents we insert the instances to our N10-009 Study Materials to concretely demonstrate the knowledge points and the diagrams to let the clients understand the inner relationship and structure of the knowledge points.
