We are hopeful that you will like our products.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q130-Q135):

NEW QUESTION # 130

An AWS Lambda function must read data from an Amazon RDS MySQL database in a VPC and also reach a public endpoint over the internet to get additional data.

Which steps must be taken to allow the function to access both the RDS resource and the public endpoint?
(Select TWO.)

- A. Modify the default network access control list to allow outbound traffic.
- B. Modify the default configuration for the Lambda function to associate it with an Amazon VPC private subnet.
- C. Add a NAT Gateway to the VPC.

- D. Add an environmental variable to the Lambda function to allow outbound internet access.
- E. Modify the default configuration of the Lambda function to associate it with a VPC public subnet.

Answer: B,C

NEW QUESTION # 131

A user is trying to create a list of IAM users with the AWS console. When the IAM users are created which of the below mentioned credentials will be enabled by default for the user?

- A. IAM passwords
- **B. Nothing. Everything is disabled by default**
- C. IAM access key and secret access key
- D. IAM X.509 certificates

Answer: B

Explanation:

Newly created IAM users have no password and no access key (access key ID and secret access key). If the user needs to administer your AWS resources using the AWS Management Console, you can create a password for the user. If the user needs to interact with AWS programmatically (using the command line interface (CLI), the AWS SDK, or service-specific APIs), you can create an access key for that user. The credentials you create for users are what they use to uniquely identify themselves to AWS.

http://docs.aws.amazon.com/IAM/latest/UserGuide/Using_WorkingWithGroupsAndUsers.html

NEW QUESTION # 132

A company is using AWS CodeBuild to compile a website from source code stored in AWS CodeCommit. A recent change to the source code has resulted in the CodeBuild project being unable to successfully compile the website. How should the Developer identify the cause of the failures?

- A. Use a custom Docker image that includes the AWS X-Ray agent in the AWS CodeBuild project configuration.
- B. Modify the buildspec.yml file to include steps to send the output of build commands to Amazon CloudWatch.
- C. Manually re-run the build process on a local machine so that the output can be visualized.
- **D. Check the build logs of the failed phase in the last build attempt in the AWS CodeBuild project build history.**

Answer: D

Explanation:

Explanation

Refer AWS documentation - CodeBuild FAQs

Q: How can I view past build results?

You can access your past build results through the console, CloudWatch, or the API. The results include outcome (success or failure), build duration, output artifact location, and log location. With the CodeBuild dashboard, you can view metrics to understand build behavior over time. The dashboard displays number of builds attempted, succeeded, and failed, as well as build duration. You can also visit the CloudWatch console to view more detailed build metrics. To learn more about monitoring CodeBuild with CloudWatch, visit our documentation.

Q: How can I debug a past build failure?

You can debug a build by inspecting the detailed logs generated during the build run or you can use CodeBuild Local to locally test and debug your builds.

NEW QUESTION # 133

A user has configured a bucket S3 to host a static website. What difference will there be when static website hosting is enabled?

- **A. It will provide the region specific website endpoint**
- B. It will help the user identify this bucket as the website root to map with the domain
- C. It will not make any difference, but will help the user to configure the error page
- D. It will create a new version of the bucket

Answer: A

Explanation:

To host a static website, the user needs to configure an Amazon S3 bucket for website hosting and then upload the website contents to the bucket. The website is then available at the region-specific website endpoint of the bucket.

Reference: <http://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html>

NEW QUESTION # 134

A Developer has an application that can upload tens of thousands of objects per second to Amazon S3 in parallel within a single AWS account. As part of new requirements, data stored in S3 must use server side encryption with AWS KMS (SSE-KMS). After creating this change, performance of the application is slower.

Which of the following is MOST likely the cause of the application latency?

- A. The client encryption of the objects is using a poor algorithm.
- B. KMS requires that an alias be used to create an independent display name that can be mapped to a CMK.
- C. Amazon S3 throttles the rate at which uploaded objects can be encrypted using Customer Master Keys.
- **D. The AWS KMS API calls limit is less than needed to achieve the desired performance.**

Answer: D

Explanation:

Explanation

<https://aws.amazon.com/about-aws/whats-new/2018/08/aws-key-management-service-increases-api-requests-per-second/> KMS API access limit is 10k/sec in us-east and some others and 5.5k/sec for the rest of the regions. Client can request this limit to be changed.

NEW QUESTION # 135

.....

With Test4Cram, you can trust that you're accessing authentic and error-free AWS-Certified-Developer-Associate exam practice questions. These questions are available in three different formats: PDF questions files, desktop practice test software, and web-based practice test software.
