Palo Alto Networks PCCP Exam Syllabus Topics:

Topic	Details

Topic 1	<ul style="list-style-type: none"> • Cloud Security: This section targets a Cloud Security Specialist and addresses major cloud architectures and topologies. It discusses security challenges like application security, cloud posture, and runtime security. Candidates will learn about technologies securing cloud environments such as Cloud Security Posture Management (CSPM) and Cloud Workload Protection Platforms (CWPP), as well as the functions of a Cloud Native Application Protection Platform (CNAPP) and features of Cortex Cloud.
Topic 2	<ul style="list-style-type: none"> • Secure Access: This part of the exam measures skills of a Secure Access Engineer and focuses on defining and differentiating Secure Access Service Edge (SASE) and Secure Service Edge (SSE). It covers challenges related to confidentiality, integrity, and availability of data and applications across data, private apps, SaaS, and AI tools. It examines security technologies including secure web gateways, enterprise browsers, remote browser isolation, data loss prevention (DLP), and cloud access security brokers (CASB). The section also describes Software-Defined Wide Area Network (SD-WAN) and Prisma SASE solutions such as Prisma Access, SD-WAN, AI Access, and enterprise DLP.
Topic 3	<ul style="list-style-type: none"> • Security Operations: This final section measures skills of a Security Operations Analyst and covers key characteristics and practices of threat hunting and incident response processes. It explains functions and benefits of security information and event management (SIEM) platforms, security orchestration, automation, and response (SOAR) tools, and attack surface management (ASM) platforms. It also highlights the functionalities of Cortex solutions, including XSOAR, Xparse, and XSIAM, and describes services offered by Palo Alto Networks' Unit 42.
Topic 4	<ul style="list-style-type: none"> • Cybersecurity: This section of the exam measures skills of a Cybersecurity Practitioner and covers fundamental concepts of cybersecurity, including the components of the authentication, authorization, and accounting (AAA) framework, attacker techniques as defined by the MITRE ATT&CK framework, and key principles of Zero Trust such as continuous monitoring and least privilege access. It also addresses understanding advanced persistent threats (APT) and common security technologies like identity and access management (IAM), multi-factor authentication (MFA), mobile device and application management, and email security.

Palo Alto Networks Certified Cybersecurity Practitioner Sample Questions (Q153-Q158):

NEW QUESTION # 153

SecOps consists of interfaces, visibility, technology, and which other three elements? (Choose three.)

- A. Understanding
- **B. Processes**
- C. Accessibility
- **D. Business**
- **E. People**

Answer: B,D,E

Explanation:

The six pillars include:

1. Business (goals and outcomes)
2. People (who will perform the work)
3. Interfaces (external functions to help achieve goals)
4. Visibility (information needed to accomplish goals)
5. Technology (capabilities needed to provide visibility and enable people)
6. Processes (tactical steps required to execute on goals)

All elements must tie back to the business itself and the goals of the security operations

NEW QUESTION # 154

If an endpoint does not know how to reach its destination, what path will it take to get there?

- A. The endpoint will not send the traffic until a path is clarified.
- B. The endpoint will forward data to another endpoint to send instead.
- C. The endpoint will broadcast to all connected network devices.
- D. The endpoint will send data to the specified default gateway.

Answer: D

Explanation:

If an endpoint does not know how to reach its destination, it will send data to the specified default gateway.

A default gateway is a device that routes traffic from a local network to other networks or the internet. The endpoint will use the default gateway's IP address as the next hop for packets that are destined for unknown or remote networks. The default gateway will then forward the packets to the appropriate destination or another gateway, based on its routing table. References:

NEW QUESTION # 155

In SecOps, what are two of the components included in the identify stage? (Choose two.)

- A. Initial Research
- B. Content Engineering
- C. Change Control
- D. Breach Response

Answer: A,B

Explanation:

In SecOps, the identify stage is the first step in the security operations lifecycle. It involves gaining knowledge and understanding of the possible security threats and establishing methods to detect, respond and proactively prevent them from occurring¹. Two of the components included in the identify stage are:

* Initial Research: This component involves gathering information about the organization's assets, vulnerabilities, risks, and compliance requirements. It also involves identifying the key stakeholders, objectives, and metrics for the SecOps project².

* Content Engineering: This component involves developing and maintaining the security content, such as rules, policies, signatures, and alerts, that will be used by the SecOps tools and processes. It also involves testing and validating the security content for accuracy and effectiveness³.

NEW QUESTION # 156

Which Palo Alto Networks tool is used to prevent endpoint systems from running malware executables such as viruses, trojans, and rootkits?

- A. Expedition
- B. Cortex XDR
- C. App-ID
- D. AutoFocus

Answer: B

Explanation:

Cortex XDR is a cloud-based, advanced endpoint protection solution that combines multiple methods of prevention against known and unknown malware, ransomware, and exploits. Cortex XDR uses behavioral threat protection, exploit prevention, and local analysis to stop the execution of malicious programs before an endpoint can be compromised. Cortex XDR also enables remediation on the endpoint following an alert or investigation, giving administrators the option to isolate, terminate, block, or quarantine malicious files or processes. Cortex XDR is part of the Cortex platform, which provides unified visibility and detection across the network, endpoint, and cloud. References:

NEW QUESTION # 157

A user is provided access over the internet to an application running on a cloud infrastructure. The servers, databases, and code of that application are hosted and maintained by the vendor.

Which NIST cloud service model is this?

- A. IaaS
- **B. SaaS**
- C. PaaS
- D. CaaS

Answer: B

Explanation:

According to the NIST definition of cloud computing¹, there are three service models for cloud computing:

Infrastructure as a Service (IaaS), Platform as a Service (PaaS), and Software as a Service (SaaS). In the SaaS model, the cloud provider delivers the software applications over the internet, and the users access them from various devices through a web browser or a program interface. The cloud provider manages the underlying infrastructure, including the servers, databases, and code of the applications. The users do not need to install, update, or maintain the software, and they only pay for the service they use. The scenario described in the question is an example of the SaaS model, as the user is provided access over the internet to an application running on a cloud infrastructure, and the vendor hosts and maintains the servers, databases, and code of that application.
