## Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q69-Q74):

### NEW QUESTION # 69

What is the name of the Kubernetes secret containing external KVDB certificates?

- A. px-kvdb
- B. px-kvdb-cert
- C. px-kvdb-auth**

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The Kubernetes secret named px-kvdb-auth is used to store external KVDB certificates in a Portworx deployment. These certificates enable mutual TLS authentication for the KVDB pods, ensuring secure and authenticated communication between the distributed KVDB instances running on different nodes. The px-kvdb-auth secret includes private keys and certificate chains that are essential for encrypting KVDB traffic and verifying peer identities within the cluster. This security feature prevents unauthorized access and protects sensitive KVDB data in transit. Portworx's official security and KVDB documentation detail the use of this secret, highlighting its role in certificate management and enabling encryption for high-availability clusters running on Kubernetes environments [【Pure Storage Portworx Security Guide source】](#).

### NEW QUESTION # 70

A Kubernetes administrator would like to transfer data from an existing Persistent Volume Claim (PVC) from another storage provider to a new Persistent Volume Claim (PVC) being provided by Portworx.

After creating the new PVC on Portworx, what must the administrator do to import the data?

- A. Run the pxctl import <SOURCE\_PVC> <DESTINATION\_PVC> command.
- B. Create a busybox pod that connects to both the source and destination PVCs and run a cp command.
- C. Create a DataExport Cluster Resource that specifies the source and destination PVC.

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To migrate data from an existing PVC backed by another storage provider to a new Portworx PVC, the administrator typically creates a temporary pod (often using a lightweight container like busybox) that mounts both the source and destination PVCs. Within this pod, standard Linux file commands such as cp or rsync are used to transfer data between volumes. This approach leverages Kubernetes volume mounting capabilities and avoids downtime by enabling data migration without removing the source volume immediately. Portworx does not provide a direct pxctl import command, nor does it use a DataExport Cluster Resource for PVC data migration. This manual method is widely documented and recommended for stateful data migration tasks involving Kubernetes PVCs across different storage backends [【 Pure Storage Portworx Data Migration Guide source】](#).

**NEW QUESTION # 71**

What is a benefit of using Autopilot in Portworx environments?

- A. It facilitates the migration of containers across clusters.
- B. It automates the expansion of storage volumes based on predefined rules.
- C. Provides enhanced security features for data protection.

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Autopilot is a key feature in Portworx designed to automate operational tasks such as capacity management and volume resizing. One of its primary benefits is automating the expansion of storage volumes based on predefined rules and thresholds. This means that when a volume approaches its storage limit, Autopilot can automatically trigger volume expansion without manual intervention, ensuring applications have uninterrupted access to storage resources. This automation reduces operational overhead, eliminates manual errors, and helps maintain application performance and availability. While Autopilot doesn't directly handle container migration or security enhancements, its dynamic volume management capabilities play a critical role in operational efficiency and business continuity. The Portworx documentation highlights Autopilot as a tool for intelligent, policy-driven storage management that adapts to workload demands in real time [【 Pure Storage Portworx Autopilot Guide source】](#).

**NEW QUESTION # 72**

What is the primary command used to back up a volume in Portworx?

- A. pxctl volume save
- B. pxctl backup volume
- C. pxctl volume snapshot create

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The primary command to back up a volume in Portworx is pxctl volume snapshot create. This command creates a point-in-time snapshot of the specified volume, capturing its state for backup or recovery purposes. Snapshots can be local or uploaded to cloud object stores as part of disaster recovery strategies. The snapshot operation is efficient and minimally intrusive, using -on-write mechanisms to avoid full data duplication. Although other commands like pxctl volume save or pxctl backup volume might exist in other storage systems, Portworx explicitly uses pxctl volume snapshot create as its core volume backup command. The Portworx CLI documentation details this command as fundamental for data protection and snapshot lifecycle management in the cluster [【 Pure Storage Portworx CLI Guide source】](#).

**NEW QUESTION # 73**

What command allows a Portworx admin to create a cloud credential for the Object Store?

- A. pxctl service credentials create
- **B. pxctl credentials create**
- C. pxctl credentials generate

#### Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Portworx, managing credentials for cloud object stores is vital to enable features like cloud snapshots and backups. The command pxctl credentials create is used to create and register cloud credentials with the Portworx cluster. This command allows administrators to specify provider details such as AWS, Google Cloud, or Azure, and input necessary access keys, secret keys, regions, and endpoints. Proper credential configuration enables Portworx to authenticate with external object stores securely, ensuring reliable data movement and disaster recovery operations. The CLI facilitates easy credential management, including listing, updating, and deleting credentials as needed. Official Portworx documentation highlights pxctl credentials create as the authoritative command for establishing cloud storage access, ensuring security best practices by managing credentials centrally within the Portworx control plane [【Pure Storage Portworx CLI Guide source】](#).
