Fortinet NSE 6 - FortiSwitch 7.2 Sample Questions (Q15-Q20):

NEW QUESTION # 15

How are the 'by VLAN redirect MAC address quarantine' mode and the 'by redirect MAC address quarantine' mode on FortiGate similar?

- A. Both modes add quarantined device MAC addresses to the blocked firewall address group.
- **B. Both modes block intra-VLAN traffic by FortiGate automatically.**
- C. Both modes move quarantined devices to the quarantine VLAN.
- D. Both modes require firewall policies to block inter-VLAN traffic.

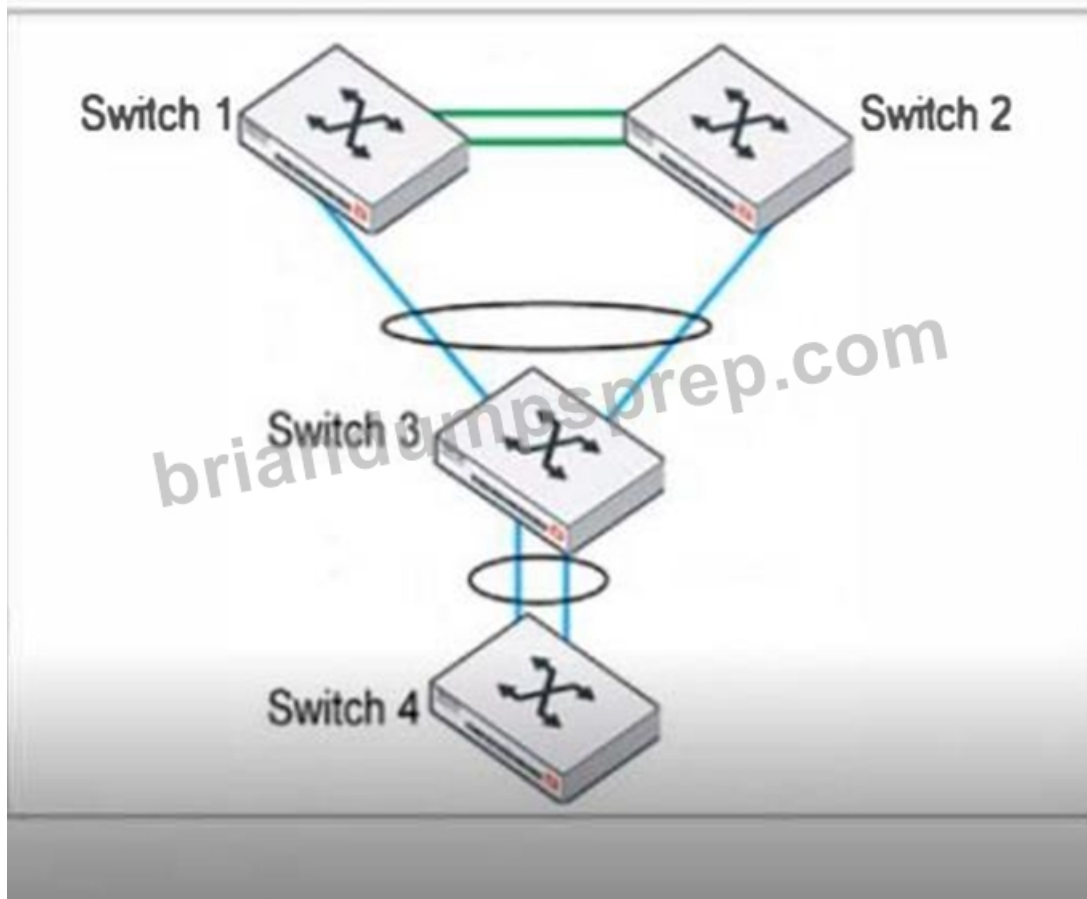

Answer: B

NEW QUESTION # 16

LAG and MLAG are used to increase the available network bandwidth and enable redundancy. How does spanning tree protocol see MLAG and LAG if they are configured based on the physical view shown in the exhibit? (Choose two)

- **A. Switch 1 and Switch 2 both seen as one single switch.**
- **B. Switch 3 and switch 4 are seen as one MLAG switch client**
- C. Switch 3 and Switch 4 uplinks are treated as single interfaces.
- D. Switch 1, Switch 2, and Switch 3 are seen as one MLAG peer group

Answer: A,B

NEW QUESTION # 17

To enhance service in emergency situations, to which LLDP-MED Type-Length-Values does Forti-Switch advertise to IP phones?

- A. Network policy
- B. Location
- **C. Inventory management**
- D. Power management

Answer: C

NEW QUESTION # 18

Which statement about the configuration of VLANs on a managed FortiSwitch port is true?

- A. Allowed VLANs expand the collision domain to the port.
- B. FortiSwitch VLAN interfaces are created only when FortiSwitch is managed by Forti-Gate.
- C. Untagged VLANs must be part of the allowed VLANs: ingress and egress.
- D. The native VLAN is implicitly part of the allowed VLAN on the port.

Answer: D

Explanation:

The native VLAN is implicitly part of the allowed VLAN on the port (C): On a managed FortiSwitch port, the native VLAN, which is the VLAN assigned to untagged traffic, is implicitly included in the list of allowed VLANs. This means it does not need to be explicitly specified when configuring VLAN settings on the port. This configuration simplifies VLAN management and ensures that untagged traffic is handled correctly without additional configuration steps.

NEW QUESTION # 19

Refer to the diagnostic output:

```
# diagnose switch-controller switch-info mac-table
Vdom: root
S224EPTF19005928 0 :
MAC address Interface vlan
-----
04:d5:90:39:73:3d internal 4092
04:d5:90:3e:e2:88 port1 4089
00:50:56:96:e3:fc GVM1V0000141680 4089
04:d5:90:39:73:3d internal 4094
00:50:56:96:e3:fc GVM1V0000141680 4094
```

Two entries in the exhibit show that the same MAC address has been used in two different VLANs. Which MAC address is shown in the above output?

- A. It is a MAC address of an upstream FortiSwitch.
- B. It is a MAC address of FortiLink interface on FortiGate.
- C. It is a MAC address of FortiGate in HA configuration.
- D. It is a MAC address of a switch that accepts multiple VLANs.

Answer: D

Explanation:

The MAC address "00:50:56:96:e3:fc" appearing in two different VLANs (4089 and 4094) in the diagnostic output indicates it is a MAC address associated with a device that supports traffic from multiple VLANs. Such a behavior is typical of network infrastructure devices like switches or routers, which are configured to allow traffic from various VLANs to pass through a single physical or logical interface. This is essential in network designs that utilize VLANs to segregate network traffic for different departments or use cases while using the same physical infrastructure.
