ISTQB (ISTQB CTAL-TA) ISTQB Certified Tester Advanced Level - Test Analyst (Syllabus 2012) Sample Questions (Q34-Q39):

NEW QUESTION # 34

Which of the following testing objectives would NOT be in focus for the Test Analyst during installability testing?

- A. Testing that different configurations of the software can be successfully installed
- B. Identifying usability issues in installation and de-installation procedures
- C. Testing the functional correctness of installation and de-installation procedures.
- D. Testing whether a given application can function correctly in all intended target environments.

Answer: D

Explanation:

The testing objective that would not be in focus for the Test Analyst during installability testing is testing whether a given application can function correctly in all intended target environments. This objective belongs to portability testing, which is a test type that evaluates the degree to which a system or component can be transferred effectively and efficiently from one hardware, software, or other operational or usage environment to another. Installability testing is a test type that evaluates how easily a system or component can be installed and/or uninstalled. NEW QUESTION # 35

You are testing an enhanced user interface for a mortgage approval program involving multiple user roles. Which test technique would be MOST suitable for this next stage of testing?

SELECT ONE OPTION

- A. Pairwise
- B. Exploratory testing
- C. Boundary Value Analysis
- D. Use Case testing

Answer: D

Explanation:

Comprehensive and Detailed in Depth Explanation:

Since the testing involves verifying the user interface (UI) enhancements and ensuring that they meet the needs of multiple user roles, Use Case Testing is the most appropriate technique.

* Use Case testing allows you to validate end-to-end user scenarios and ensure the system behaves correctly for each role, focusing on user interactions and usability.

* Exploratory testing (A) might be useful for finding unexpected issues, but it lacks the structured approach needed for role-based UI validation.

* Boundary Value Analysis (B) is useful for testing numeric input limits, not UI roles.

* Pairwise testing (D) focuses on combinatorial testing, not role-based UI testing.

The correct answer is C (Use Case testing).

NEW QUESTION # 36

In the recent past, you have learned that test automation just using capture & playback tooling, possibly enhanced with some test programming, has limitations. For the next banking project, that will be run using Agile methods, you want to implement a keyword-driven test automation approach. You have already started to define some high-level test cases for the account transfer user story:

TC 1 transfer € 150 from Lars to Ann, verify Ann's balance to be € 150

TC 2 transfer € 300 from Tim to Ann, verify Ann's balance to be € 450

In the context of implementing the keyword-driven test automation approach, which of the following activities should now be conducted by the Test Analyst?

- A. Define keywords to be implemented, eg, check balance.

B Design test navigation scripts.

- B. Work together with a developer to define a test automation architecture
- C. Select a tool to support keyword-driven testing

Answer: A

Explanation:

The activity that should now be conducted by the Test Analyst in the context of implementing the keyword- driven test automation approach is to define keywords to be implemented, e.g., check balance. A keyword- driven test automation approach is an approach that uses keywords to represent actions or data in a test case.

The keywords are then interpreted by a test execution tool or framework that performs the corresponding actions or data manipulation. The Test Analyst is responsible for defining the keywords that are relevant and meaningful for the test cases, such as check balance, transfer money, verify message, etc. Verified References: [ISTQB Certified Tester Advanced Level Test Analyst CTAL-TA], Section 6.1.1, page 73.

NEW QUESTION # 37

You work for a company that is a pioneer in smart energy technology. One of their core products is their energy monitor in-home display device, used to display current and historic energy consumption data to many thousands of customers. It has been designed to integrate with their other smart home products, including domestic lighting control systems via their HomeHub.

The company is to launch a new application for smartphones and tablets that will allow its customers to view their energy readings remotely and to view their daily budget usage based on seasonal historic data. The application must also support customers with disabilities.

The application is being delivered using a hybrid mix of agile and V-model methodologies over three iterations:

* Iteration 1: Development of the new application to work on the IOS operating system only

* Iteration 2: Enhancement to the application to also work on the Android operating system

* Iteration 3: Enhancement to the application to provide daily budget usage The test manager has provided you with a list of high-level test conditions and has asked you, as Test Analyst, to select the test conditions that address functional suitability, portability, usability, and accessibility for Iteration 1 only. Which TWO of the following test conditions should you select?

a) The application will accept voice recognition commands made via IOS devices b) The application is both learnable and operable for customers when used on Android devices c) There is no loss or corruption of data transmitted between the energy monitor and other smart-home products d) The daily budget usage is accurately calculated from seasonal historic data running on Android e) The application can be installed on all currently supported versions of IOS for all supported smartphones and tablets SELECT ONE

OPTION:

- A. a, e
- B. b, d
- C. a, b
- D. c, e

Answer: A

Explanation:

Comprehensive and Detailed In-Depth Explanation:

* a) Accessibility: Voice recognition commands are an accessibility feature, relevant for iOS (Iteration 1).

* e) Portability: Ensuring the application can be installed on all iOS devices is relevant for Iteration 1.

* b) Irrelevant, as it pertains to Android (Iteration 2).

* c) Data integrity, not related to functional suitability, portability, or accessibility.

* d) Daily budget usage (Iteration 3) is out of scope for Iteration 1.

Therefore, the correct answer is C (a, e).

NEW QUESTION # 38

For an ATM banking project the following applies: "When the user first inserts a valid credit card, the system considers the user to be in an unauthenticated state. When requesting a cash advance, the user must be in an authenticated state. The user authenticates by entering the correct PIN code for the card they have used.

During the user authentication, the system shall allow the user to enter their PIN code up to three times before failing the authentication and rejecting the card. On the first and second try, the system shall prompt the user to re-enter the PIN code "

Suppose you are concerned that, depending on the number of invalid PIN codes entered, the system may behave incorrectly. Which of the following test design techniques is specifically targeted at finding such failures?

- A. State transition testing using 1-switch coverage
- B. Pairwise testing
- C. Equivalence partitioning
- D. Classification tree technique

Answer: A

Explanation:

The test design technique that is specifically targeted at finding failures depending on the number of invalid PIN codes entered is state transition testing using 1-switch coverage. State transition testing is a technique that tests the behavior of a system or component based on its states and transitions between them. A 1-switch test case is a test case that covers two states and the transition between them. This technique can test how the system reacts to different sequences of events and how it handles invalid inputs. Verified
