**Authoritative Updated DCA Demo | Amazing Pass Rate For DCA: Docker Certified Associate (DCA) Exam | Accurate Braindumps DCA Torrent**

The Docker DCA PDF questions file of ExamBoosts has real Docker DCA exam questions with accurate answers. You can download Docker PDF Questions file and revise Docker Certified Associate (DCA) Exam DCA exam questions from any place at any time. We also offer desktop DCA practice exam software which works after installation on Windows computers. The DCA web-based practice test on the other hand needs no software installation or additional plugins. Chrome, Opera, Microsoft Edge, Internet Explorer, Firefox, and Safari support the web-based DCA Practice Exam. You can access the Docker DCA web-based practice test via Mac, Linux, iOS, Android, and Windows. ExamBoosts Docker Certified Associate (DCA) Exam DCA practice test (desktop & web-based) allows you to design your mock test sessions. These Docker DCA exam practice tests identify your mistakes and generate your result report on the spot.

## Docker Certified Associate (DCA) Exam Sample Questions (Q153-Q158):

### NEW QUESTION # 153

Will this configuration achieve fault tolerance for managers in a swarm?

Solution: an odd number of manager nodes, totaling more than two

- A. No
- B. Yes

**Answer: B**

Explanation:

Explanation

This configuration will achieve fault tolerance for managers in a swarm, because an odd number of manager nodes allows for quorum-based consensus among managers and avoids split-brain scenarios. According to the official documentation, having more than two manager nodes ensures that there is always at least one manager available in case of failures.

References: [https://docs.docker.com/engine/swarm/admin\\_guide/#add-manager-nodes-for-fault-tolerance](https://docs.docker.com/engine/swarm/admin_guide/#add-manager-nodes-for-fault-tolerance)

### NEW QUESTION # 154

Is this a Linux kernel namespace that is disabled by default and must be enabled at Docker engine runtime to be used?

Solution: user

- A. No
- B. Yes

**Answer: B**

Explanation:

Explanation

user is a Linux kernel namespace that is disabled by default and must be enabled at Docker engine runtime to be used. According to the official documentation, user namespace support must be explicitly enabled in two ways:

The dockerd daemon must be started with --userns-remap flag.

The user or group specified for --userns-remap must have subordinate user and group IDs allocated in /etc/subuid and /etc/subgid files.

References: <https://docs.docker.com/engine/security/userns-remap/#enable-userns-remap-on-the-daemon>

<https://docs.docker.com/engine/security/userns-remap/#prerequisites-for-user-namespace-remapping>

### NEW QUESTION # 155

The following Docker Compose file is deployed as a stack:

```
version: '3.1'
services:
  app:
    image: app:1.0
    healthcheck:
      test: "curl --fail http://localhost/health || exit 1"
      interval: 10s
      timeout: 5s
      retries: 3
```

Is this statement correct about this health check definition?

Solution: Health checks test for app health ten seconds apart. Three failed health checks transition the container into "unhealthy" status.

- A. No

- B. Yes

**Answer: B**

Explanation:

The statement is correct. In the provided Docker Compose file, a health check is defined for the service "app".

It uses curl to perform a health check on the application every 10 seconds (as specified by the "interval" parameter). If it fails three times (as specified by the "retries" parameter), then the container is marked as unhealthy. A health check is a way of checking the health of a running container and applying actions based on the result<sup>1</sup>. It can be used to monitor the status of the service and restart the container if it becomes unhealthy<sup>2</sup>. References:

#### NEW QUESTION # 156

A docker service 'web' is running with a scale factor of 1 (replicas = 1).

Bob intends to use the command 'docker service update --replicas=3 web'.

Alice intends to use the command 'docker service scale web=3'.

How do the outcomes of these two commands differ?

- A. Bob's command results in an error. Alice's command updates the number of replicas of the 'web' service to 3.
- B. Bob's command updates the number of replicas of the 'web' service to 3. Alice's command results in an error.
- C. Bob's command only updates the service definition, but no new replicas are started. Alice's command results in the actual scaling up of the 'web' service.
- D. Both Bob's and Alice's commands result in exactly the same outcome, which is 3 instances of the 'web' service.

**Answer: D**

#### NEW QUESTION # 157

Will this command mount the host's '/data1' directory to the ubuntu container in read-only mode?

Solution: 'docker run -v /data:/mydata -mode readonly ubuntu'

- A. Yes
- B. No

**Answer: B**

Explanation:

Explanation

The command `docker run -v /data:/mydata -mode readonly ubuntu` will not mount the host's /data1 directory to the ubuntu container in read-only mode. The command has several errors that prevent it from working correctly. First, the host directory should be /data1 instead of /data, as specified in the question. Second, the option flag should be --mode instead of -mode, and it should be placed before the image name. Third, the mode value should be ro instead of readonly, as per the Docker documentation<sup>1</sup>. The correct command should be `docker run -v /data1:/mydata --mode ro ubuntu`, which will mount the host's /data1 directory as a read-only volume at /mydata inside the container<sup>1</sup>.
