What's more, part of that Lead1Pass AZ-120 dumps now are free: <https://drive.google.com/open?id=1cA-u7c23px4Ej6QJ-UiGtb9d9Lz4iVsr>

If you are a college student, you can learn and use online resources through the student learning platform over the AZ-120 study materials. And for an office worker, the AZ-120 study engine is designed to their different learning arrangement as well, such extensive audience greatly improved the core competitiveness of our AZ-120 practice quiz, which is according to their aptitude, on-demand, maximum to provide users with better suited to their specific circumstances.

Microsoft AZ-120 certification exam is aimed at IT professionals who have experience in managing complex SAP solutions in a large-scale enterprise environment. Candidates must have a deep understanding of the various components of an SAP landscape, including SAP HANA, SAP NetWeaver, and SAP Business Suite, and how these components can be deployed and managed in Azure.

Earning the Microsoft AZ-120 certification demonstrates a candidate's ability to deploy and manage SAP workloads on Azure. Planning and Administering Microsoft Azure for SAP Workloads certification validates the candidate's expertise in designing, implementing, and maintaining SAP solutions on Azure infrastructure. Planning and Administering Microsoft Azure for SAP Workloads certification can open up new career opportunities for professionals in the field of SAP and cloud computing. Additionally, Microsoft Certified Professionals (MCPs) gain access to exclusive benefits, such as access to the Microsoft Certified Professional community and discounts on Microsoft products and services.

## Step 2: Making a Study Guide Your Companion

The study guides can be one of the best companions for anyone who is preparing for the Microsoft AZ-120 Exam. The official tutorial is readily available on the certification webpage. It enhances the preparation process by simply helping you identify the skills required for the test.

>> Valid AZ-120 Exam Test <<

## Fantastic Valid AZ-120 Exam Test & Passing AZ-120 Exam is No More a Challenging Task

If passing the AZ-120 certification exam in a short time is a goal of yours, we're here to help you get there on your first attempt by providing you with AZ-120 real exam dumps you need to succeed. We have three formats of AZ-120 updated questions. This is done so that every Microsoft AZ-120 exam applicant may find useful AZ-120 study material here, regardless of how they want to learn.

## Microsoft Planning and Administering Microsoft Azure for SAP Workloads Sample Questions (Q17-Q22):

NEW QUESTION # 17

You have an Azure subscription.  
 You plan to deploy a QA landscape to SAP on Azure by using Azure Center for SAP solutions.  
 You need to use the Azure command-line interface (CLI) to deploy the landscape.  
 How should you complete the command? To answer, select the appropriate options in the answer area.  
 NOTE: Each correct selection is worth one point.

Answer Area

az workloads  create -g RG1 -n NonProd --environment

NonProd  s4hana

Answer:

Explanation:

Answer Area

az workloads  create -g RG1 -n NonProd --environment

NonProd  s4hana

Explanation:

Answer Area

az workloads  create -g RG1 -n NonProd --environment

NonProd  s4hana

### NEW QUESTION # 18

Your on-premises network contains an Active Directory domain.  
 You are deploying a new SAP environment on Azure.  
 You need to configure SAP Single Sign-On to ensure that users can authenticate to SAP GUI and SAP WebGUI.  
 Which four actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Actions

Deploy Azure Active Directory Domain Services (Azure AD DS) and sync back to Active Directory.

Create an Azure Key Vault service endpoint.

Configure secure network communication (SNC) by using SNCWIZARD.

Change and deploy the logon file.

Change the user profiles for secure network communication (SNC.)

Answer Area

Answer:

Explanation:

| Answer Area                                                                                  |
|----------------------------------------------------------------------------------------------|
| Change the user profiles for secure network communication (SNC)                              |
| Deploy Azure Active Directory Domain Service (Azure AD DS) and sync back to Active Directory |
| Configure secure network communication (SNC) by using SNCWIZARD.                             |
| Change and deploy the logon file.                                                            |

- 1 - Change the user profiles for secure network communication (SNC)
- 2 - Deploy Azure Active Directory Domain Service (Azure AD DS) and sync back to Active Directory
- 3 - Configure secure network communication (SNC) by using SNCWIZARD.
- 4 - Change and deploy the logon file.

### NEW QUESTION # 19

You have an Azure subscription that contains a resource group named RG1. The role assignments for RG1 are shown in the following exhibit.

```
Azure:/
PS Azure:\> Get-AZRoleAssignment -ResourceGroupName RG1 | Where DisplayName -Like "user*"
| Select DisplayName, RoleDefinitionName
```

| DisplayName | RoleDefinitionName        |
|-------------|---------------------------|
| User3       | User Access Administrator |
| User2       | Backup Contributor        |
| User1       | Contributor               |
| User4       | Security Admin            |

Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.

NOTE: Each correct selection is worth one point.

|                                                                                        |                                             |
|----------------------------------------------------------------------------------------|---------------------------------------------|
| <div><div></div><div>User1</div><div>User2</div><div>User3</div><div>User4</div></div> | can create a Recovery Services vault in RG1 |
| <div><div></div><div>User1</div><div>User2</div><div>User3</div><div>User4</div></div> | can assign User4 as an owner of RG1         |

Answer:

Explanation:

|       |   |
|-------|---|
|       | ▼ |
| User1 |   |
| User2 |   |
| User3 |   |
| User4 |   |

can create a Recovery Services vault in RG1

|       |   |
|-------|---|
|       | ▼ |
| User1 |   |
| User2 |   |
| User3 |   |
| User4 |   |

can assign User4 as an owner of RG1

Explanation

Graphical user interface, application, table Description automatically generated

|       |   |
|-------|---|
|       | ▼ |
| User1 |   |
| User2 |   |
| User3 |   |
| User4 |   |

can create a Recovery Services vault in RG

|       |   |
|-------|---|
|       | ▼ |
| User1 |   |
| User2 |   |
| User3 |   |
| User4 |   |

can assign User4 as an owner of RG1

Box 1: User2

Graphical user interface, application, table Description automatically generated

| Management Operation                                                                                               | Minimum Azure role required | Scope Required                      |
|--------------------------------------------------------------------------------------------------------------------|-----------------------------|-------------------------------------|
|  Create Recovery Services vault | Backup Contributor          | Resource group containing the vault |

Note:

Backup Contributor - This role has all permissions to create and manage backup except deleting Recovery Services vault and giving access to others. Imagine this role as admin of backup management who can do every backup management operation.

Box 2: User3

The User Access Administrator role lets you manage user access to Azure resources.

## NEW QUESTION # 20

You have the following Azure Resource Manager template.

```
{
  "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "1.0.0.0",
  "parameters": {},
  "resources": [
    {
      "apiVersion": "2016-01-01",
      "type": "Microsoft.Storage/storageAccounts",
      "name": "[concat(copyIndex(), 'storage', uniqueString(resourceGroup().id))]",
      "location": "[resourceGroup().location]",
      "sku": {
        "name": "Premium_LRS"
      },
      "kind": "Storage",
      "properties": {},
      "copy": {
        "name": "storagecopy",
        "count": 6,
        "mode": "Serial",
        "batchSize": 1
      }
    }
  ]
}
```

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

| Statements                                                   | Yes                   | No                    |
|--------------------------------------------------------------|-----------------------|-----------------------|
| Six storage accounts will be created.                        | <input type="radio"/> | <input type="radio"/> |
| The storage accounts will be created in parallel.            | <input type="radio"/> | <input type="radio"/> |
| The storage accounts will be replicated to multiple regions. | <input type="radio"/> | <input type="radio"/> |

Answer:

Explanation:

| Statements                                                   | Yes                              | No                               |
|--------------------------------------------------------------|----------------------------------|----------------------------------|
| Six storage accounts will be created.                        | <input checked="" type="radio"/> | <input type="radio"/>            |
| The storage accounts will be created in parallel.            | <input type="radio"/>            | <input checked="" type="radio"/> |
| The storage accounts will be replicated to multiple regions. | <input type="radio"/>            | <input checked="" type="radio"/> |

Explanation

Box 1: Yes

Count is 6.

Box 2: No

Mode is serial.

Box 3: NO

### NEW QUESTION # 21

You have an Azure Availability Set that is configured as shown in the following exhibit.

```
PS Azure:\> get-azavailabilityset | Select Sku, PlatformFaultDomainCount, PlatformUpdateDomainCount, name, type | FL
```

|                           |                                      |
|---------------------------|--------------------------------------|
| Sku                       | : Aligned                            |
| PlatformFaultDomainCount  | : 2                                  |
| PlatformUpdateDomainCount | : 4                                  |
| Name                      | : SAP-Databases-AS                   |
| Type                      | : Microsoft.Compute/availabilitySets |

Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.

NOTE: Each correct selection is worth one point.

|                                                                                      |                                                                                            |
|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| Virtual machines that share [answer choice] will be susceptible to a storage outage. | <div>aligned SKUs</div> <div>the same fault domain</div> <div>the same update domain</div> |
| Virtual machines in the Azure Availability Set can support [answer choice].          | <div>datacenter outages</div> <div>managed disks</div> <div>regional outages</div>         |

Answer:

Explanation:

|                                                                                      |                                                                                            |
|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| Virtual machines that share [answer choice] will be susceptible to a storage outage. | <div>aligned SKUs</div> <div>the same fault domain</div> <div>the same update domain</div> |
| Virtual machines in the Azure Availability Set can support [answer choice].          | <div>datacenter outages</div> <div>managed disks</div> <div>regional outages</div>         |

Explanation:

Box 1: the same fault domain

Fault domains define the group of virtual machines that share a common power source and network switch. If a storage fault domain fails due to hardware or software failure, only the VM instance with disks on the storage fault domain fails.

Box 2: managed disks

Managed disks provide better reliability for Availability Sets by ensuring that the disks of VMs in an Availability Set are sufficiently isolated from each other to avoid single points of failure. It does this by automatically placing the disks in different storage fault domains (storage clusters) and aligning them with the VM fault domain.
