PAP-001 Exam Torrents: Certified Professional - PingAccess Prepare Torrents & PAP-001 Test Braindumps

With the consistent reform in education, our PAP-001 test question also change with the newest education regulation. We have strong confidence in offering the first-class PAP-001 study prep to our customers. So what you have learned is fully conforming to the latest test syllabus. Also, our specialists can predicate the PAP-001 exam precisely. Firstly, our company has summed up much

experience after so many years' accumulation. The model test is very important. You are advised to master all knowledge of the model test. Most of the real exam questions come from the adaption of our PAP-001 Test Question. In fact, we get used to investigate the real test every year. The similarity between our study materials and official test is very amazing. In a word, your satisfaction and demands of the PAP-001 exam braindump is our long lasting pursuit. Hesitation will not generate good results. Action always speaks louder than words. Our PAP-001 study prep will not disappoint you. So just click to pay for it.

Ping Identity Certified Professional - PingAccess Sample Questions (Q13-Q18):

NEW QUESTION # 13

The performance testing team finds that an API hosted in a remote datacenter is experiencing higher response times compared to similar APIs hosted onsite. Which option in PingAccess can be used to improve performance in this scenario?

- A. Reduce the number of attributes in the ID Token
- B. Move the API to a separate Virtual Host
- C. Reduce the Key Roll Interval on the web session
- **D. Enable Cache Token on the OAuth Resource Server**

Answer: D

Explanation:

When APIs are remote, latency is introduced by frequent token validation requests. Enabling Cache Token on the OAuth Resource Server reduces repeated validation calls and improves performance.

Exact Extract:

"The OAuth Resource Server configuration includes a Cache Token option that improves performance by reducing round trips for token validation."

* Option A is incorrect - key rolling affects cryptographic keys, not API latency.

* Option B is incorrect - virtual hosts control external FQDNs, not performance.

* Option C is incorrect - token attribute size does not significantly affect remote latency.

* Option D is correct - caching tokens reduces validation overhead.

Reference: PingAccess Administration Guide - OAuth Resource Server Settings

NEW QUESTION # 14

During a business review of an application, the administrator needs to change the Resource Authentication to anonymous. What are the two effects of making this change to the resource? (Choose 2 answers.)

- **A. The resource requires no further authentication, and Identity Mappings still apply.**
- B. The resource requires no further authentication, and all Access Control rules still apply.
- **C. The resource requires no further authentication, and Processing rules still apply.**
- D. Requests to this resource are not logged, and Identity Mappings are applied.
- E. The resource requires no further authentication, and no rules will apply.

Answer: A,C

Explanation:

When a resource is configured as anonymous, PingAccess does not challenge the user for authentication.

However, certain processing and identity propagation still occur.

Exact Extract:

"Anonymous resources do not require authentication. Identity mappings and request/response processing rules still apply."

* Option A is incorrect because rules such as identity mappings and processing still apply.

* Option B is correct - Identity Mappings can still forward attributes, even for anonymous access.

* Option C is correct - Processing rules (e.g., request/response modifications) still apply.

* Option D is incorrect - requests are logged; anonymous does not disable logging.

* Option E is incorrect - access control rules (authorization) are not evaluated for anonymous resources.

NEW QUESTION # 15

Users report the following about access to an application:

- * Inconsistent behavior depending on the browser used
 - * Denied access
 - * Prompt to accept a security exception
- Which configuration option should the administrator adjust?

- A. Validate Session
- **B. SameSite Cookie**
- C. Enable PKCE
- D. Request Preservation

Answer: B

Explanation:

Modern browsers enforce stricter cookie handling rules. If cookies are not configured correctly with the SameSite attribute, behavior can differ across browsers, leading to inconsistent authentication and access denials. Security exceptions may appear when session cookies are blocked.

Exact Extract:

"The SameSite cookie setting defines how browsers send cookies in cross-site requests. Misconfigured SameSite values can lead to inconsistent application behavior across browsers."

- * Option A (Enable PKCE) is related to OAuth flow security, not browser cookie behavior.
- * Option B (SameSite Cookie) is correct - this directly explains the inconsistent browser issues.
- * Option C (Request Preservation) ensures query parameters are kept, not related to cross-browser session handling.
- * Option D (Validate Session) checks session state but does not address browser inconsistencies.

Reference: PingAccess Administration Guide - Web Session Cookie Settings

NEW QUESTION # 16

An organization wants to take advantage of a new product feature that requires upgrading the PingAccess cluster from 7.3 to the current version. The administrator downloads the required files and places the files on the PingAccess servers. What should the administrator do next?

- A. Disable cluster communication.
- B. Upgrade the Replica Admin.
- **C. Upgrade the Admin Console.**
- D. Disable Key Rolling.

Answer: C

Explanation:

When upgrading a PingAccess cluster, the Admin Console node must always be upgraded first before any replica admin or engine nodes. This ensures that the configuration and schema changes introduced in the new version are properly applied and replicated.

Exact Extract (from PingAccess documentation):

"In a clustered environment, you must first upgrade the administrative console node before upgrading any replica administrative nodes or engine nodes." Why A is correct:

- * A. Upgrade the Admin Console- This is correct because the admin console node acts as the configuration master in a PingAccess cluster. Upgrading it first ensures the new version schema is available to replicas and engines.

Why the other options are incorrect:

- * B. Disable cluster communication- This is not required for standard upgrades. Cluster communication remains in place to synchronize changes after the upgrade.
- * C. Disable Key Rolling- Key rolling is unrelated to the upgrade process. It is a feature used for key rotation, not version upgrades.
- * D. Upgrade the Replica Admin- This is incorrect because upgrading a replica admin before the primary administrative console is against the documented procedure and would cause replication issues.

NEW QUESTION # 17

An application owner would like customized errors for rule violations within an application. Where is this configured?

- A. When combining Rules into Rule Sets

- B. Within the Root Resource of the Application
- C. When assigning a Rule to a Resource
- D. Within the Rule definition

Answer: B

Explanation:

PingAccess allows administrators to configure custom error pages or messages at the Root Resource level of an application. This ensures that when rule violations (e.g., authorization failures) occur, the application can display tailored error responses.

Exact Extract:

"Custom error handling for rule violations is configured within the Root Resource of an application."

- * Option A is incorrect - assigning a rule to a resource does not allow defining custom errors.
- * Option B is correct - the Root Resource is where administrators define custom error handling for the entire application.
- * Option C is incorrect - Rule Sets only combine rules; they do not handle error responses.
- * Option D is incorrect - individual rule definitions do not contain custom error configurations.
