Free PDF 100-160 - High Pass-Rate Cisco Certified Support Technician (CCST) Cybersecurity Latest Study Questions

DOWNLOAD the newest PassLeader 100-160 PDF dumps from Cloud Storage for free: https://drive.google.com/open?id=1tDJ1ssUlxJmdEJewekRVmgeb9X_fGA-S

The downloading process is operational. It means you can obtain 100-160 quiz torrent within 10 minutes if you make up your mind. Do not be edgy about the exam anymore, because those are latest 100-160 exam torrent with efficiency and accuracy. You will not need to struggle with the exam. Besides, there is no difficult sophistication about the procedures, our latest 100-160 Exam Torrent materials have been in preference to other practice materials and can be obtained immediately.

Cisco 100-160 Exam Syllabus Topics:

Topic	Details
Topic 1	• Endpoint Security Concepts:This section of the exam measures the skills of an Endpoint Security Specialist and includes securing individual devices, understanding protections such as antivirus, patching, and access control at the endpoint level, essential for maintaining device integrity.
Topic 2	• Essential Security Principles: This section of the exam measures the skills of a Cybersecurity Technician and covers foundational cybersecurity concepts such as the CIA triad (confidentiality, integrity, availability), along with basic threat types and vulnerabilities, laying the conceptual groundwork for understanding how to protect information systems.
Topic 3	• Vulnerability Assessment and Risk Management: This section of the exam measures the skills of a Risk Management Analyst and entails identifying and assessing vulnerabilities, understanding risk priorities, and applying mitigation strategies that help manage threats proactively within an organization's systems
Topic 4	• Basic Network Security Concepts: This section of the exam measures the skills of a Network Defender and focuses on understanding network-level protections, including firewalls, VPNs, and intrusion detection • prevention systems, providing insight into how threats are mitigated within network environments.
Topic 5	• Incident Handling: This section of the exam measures the skills of an Incident Responder and centers on recognizing security incidents, responding appropriately, and containing threats—forming the essential foundation of incident response procedures.

Valid 100-160 Exam Sims - 100-160 Pdf Free

Our 100-160 test questions provide free trial services for all customers so that you can better understand our products. You can experience the effects of outside products in advance by downloading clue versions of our 100-160 exam torrent. In addition, it has simple procedure to buy our learning materials. After your payment is successful, you will receive an e-mail from our company within 10 minutes. After you click on the link and log in, you can start learning using our 100-160 test material. You can download our 100-160 test questions at any time. If you encounter something you do not understand, in the process of learning our 100-160 exam torrent, you can ask our staff. We provide you with 24-hour online services to help you solve the problem. Therefore we can ensure that we will provide you with efficient services.

Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q171-Q176):

NEW QUESTION # 171
Which two basic metrics should be taken into consideration when assigning a severity to a vulnerability during an assessment? (Choose 2.)

- A. The impacts that an exploit of the vulnerability will have on the organization
- B. The age of the hardware running the software that contains the vulnerability
- C. The likelihood that an adversary can and will exploit the vulnerability
- D. The time involved in choosing replacement software to replace older systems

Answer: A,C

Explanation:
The CCST Cybersecurity course describes that risk scoring for vulnerabilities often involves likelihood and impact - similar to the CVSS (Common Vulnerability Scoring System) model.
"When prioritizing vulnerabilities, assess both the likelihood of exploitation and the potential impact to the organization. Likelihood measures how easy or probable it is for an adversary to exploit the weakness, while impact measures the consequences to confidentiality, integrity, and availability if exploitation occurs." (CCST Cybersecurity, Vulnerability Assessment and Risk Management, Risk Assessment and Prioritization section, Cisco Networking Academy) A is correct: Likelihood is a fundamental part of severity assessment.
B is correct: Impact determines how damaging an exploit would be.
C is incorrect: Time to choose replacement software is an operational consideration, not a severity metric.
D is incorrect: Hardware age may influence performance but does not directly define vulnerability severity.

NEW QUESTION # 172
When should a firewall rule triggering block external access to a network resource be escalated?

- A. Only if the access was authorized.
- B. Always, regardless of authorization.
- C. Never, as it is a normal security function of a firewall.
- D. Only if the access attempt is from a known malicious IP address.

Answer: C

Explanation:
Blocking external access to a network resource is a normal security function of a firewall and does not necessarily require escalation. Firewalls are designed to monitor and control incoming and outgoing network traffic based on predetermined rules and configurations. However, if the rule is triggered unexpectedly or causes disruption to critical services, it may be appropriate to escalate the issue for further investigation or adjustment of the firewall rule.

NEW QUESTION # 173
You are going to perform a penetration test on a company LAN. As part of your preparation, you access the company's websites, view webpage source code, and run internet searches to uncover domain information. You also use social media to gather details about the company and its employees.
Which type of reconnaissance activities are you performing?

- A. Offline
- B. Active

- C. Invasive
- D. Passive

Answer: D

Explanation:
The CCST Cybersecurity Study Guide explains that reconnaissance is the process of collecting information about a target before attempting exploitation.
"Passive reconnaissance is conducted without directly engaging with the target systems. Examples include reviewing public websites, examining HTML source code, querying public DNS records, and using social media to gather information. Since no packets are sent directly to the target system, it reduces the risk of detection." (CCST Cybersecurity, Vulnerability Assessment and Risk Management, Reconnaissance Techniques section, Cisco Networking Academy) Passive (A) is correct because all actions described - viewing public pages, searching online, and checking social media - involve no direct interaction that could alert the target.
Active (B) would involve direct probing, like port scans or vulnerability scans.
Offline (C) is not an official reconnaissance classification in this context.
Invasive (D) is a general term and not used as a standard reconnaissance category in CCST material.

NEW QUESTION # 174
Which of the following is a common vulnerability management practice?

- A. Installing antivirus software on all company devices.
- B. Regularly patching software and operating systems.
- C. Encrypting all data at rest in a database.
- D. Restricting network access based on IP addresses.

Answer: B

Explanation:
Regularly patching software and operating systems is a common practice in vulnerability management. Software and operating system vendors release security patches and updates to address known vulnerabilities. By regularly applying these patches, organizations can mitigate the risk of exploitation. Failure to patch systems in a timely manner can leave them vulnerable to attacks that exploit known vulnerabilities.

NEW QUESTION # 175
Which of the following techniques is commonly used for monitoring security events "as they occur"?

- A. Access control lists (ACL)
- B. Vulnerability scanning
- C. Firewall configuration
- D. Intrusion detection systems (IDS)

Answer: D

Explanation:
Intrusion detection systems (IDS) are commonly used for monitoring security events in real-time. IDS monitors network traffic and system activity, looking for signs of unauthorized access, malicious activities, or anomalous behavior. When an intrusion is detected, the system generates alerts for immediate action and response.
