

Free PDF 1z0-076 - Accurate Dumps Oracle Database 19c: Data Guard Administration Free Download

2025 Latest Real4test 1z0-076 PDF Dumps and 1z0-076 Exam Engine Free Share: <https://drive.google.com/open?id=1MysPki8T32KmM1saOAJvGgIr70gjL0pI>

Review the products offered by us by downloading 1z0-076 free demos and compare them with the study material offered in online course free and vendors' files. You will find our 1z0-076 exam dumps the better than our competitors such as exam collection and others. The excellent quality of our 1z0-076 exam dumps content, their relevance with the actual 1z0-076 Exam needs and their interactive and simple format will prove them superior and quite pertinent to your needs and requirements. If you just make sure learning of the content in the guide, there is no reason of losing the 1z0-076 exam.

Oracle 1z0-076 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Creating a Data Guard Broker Configuration: This section delves into the practical aspects of creating and managing a Data Guard broker configuration, including command-line and Enterprise Manager approaches.
Topic 2	<ul style="list-style-type: none">Backup and Recovery Considerations in an Oracle Data Guard Configuration: In this topic, Backup and recovery procedures in a Data Guard configuration are discussed, including RMAN backups, offloading to physical standby, and network-based recovery.
Topic 4	<ul style="list-style-type: none">Using Oracle Active Data Guard: Supported Workloads in Read-Only Standby Databases: Here, the usage of physical standby databases for real-time queries is discussed.
Topic 5	<ul style="list-style-type: none">Managing Physical Standby Files After Structural Changes on the Primary Database: The topic covers managing structural changes in the primary database and their impact on physical standby files.
Topic 6	<ul style="list-style-type: none">Managing Oracle Net Services in a Data Guard Environment: The section focuses on Oracle Net Services and its role in Data Guard networking setup.
Topic 7	<ul style="list-style-type: none">Oracle Data Guard Basics: This topic covers the essential architecture and concepts of Oracle Data Guard. It includes sub-topics such as the physical and logical standby database comparison, benefits of Data Guard, and its integration with multi-tenant databases.
Topic 8	<ul style="list-style-type: none">Monitoring a Data Guard Broker Configuration: The topic covers the use of Enterprise Manager and DGMGRL to monitor Data Guard configurations and explains the various data protection modes available.

- Oracle Data Guard Broker Basics: An overview of the Data Guard broker, its architecture, components, benefits, and configurations, is provided here. It serves as an introduction to the tool used for managing Data Guard configurations.

Trustworthy 1z0-076 Pdf | Test 1z0-076 Simulator Fee

Our 1z0-076 practice materials can be understood with precise content for your information, which will remedy your previous faults and wrong thinking of knowledge needed in this exam. As a result, many customers get manifest improvement and lighten their load by using our 1z0-076 Actual Exam. It is well-known that our 1z0-076 study guide can save a lot of time and effort. And with the simplified content of our 1z0-076 practice questions, you can have a wonderful study experience as well.

Oracle Database 19c: Data Guard Administration Sample Questions (Q60-Q65):

NEW QUESTION # 60

Which three are true about using Flashback database through role transitions in a Data Guard environment?

- A. Flashback database may not be used to undo a physical standby database activation.
- B. Logical standby database roles are reverted to their original role when you flash back to a point in time before the switchover occurred which caused this database to become a logical standby.
- C. Logical standby databases retain their current role when you flash back through to a point in time before the switchover occurred which caused this database to become a logical standby.
- D. Physical standby databases retain their current role when you flash back to a point in time before the switchover occurred which caused this database to become a physical standby.
- E. Physical standby databases retain their current role when you flash back to a point in time before a reinstate occurred which caused this database to become a physical standby.

Answer: A,D,E

NEW QUESTION # 61

Which THREE statements are TRUE about Global Sequences when connected to a physical standby database with Real-Time Query enabled?

- A. Their creation requires that a LOG archive_dest_n parameter be defined in the standby that points back to the primary.
- B. They must have the NOORDER and CACHE options set.
- C. If the CACHE option is set then the size of the cache must be at least 100.
- D. Their usage may have a performance impact on the physical standby database if the CACHE size is too small.
- E. Their usage will always have a performance impact on the primary database.

Answer: B,D,E

Explanation:

Global Sequences are Oracle sequences that generate unique values across multiple instances in an Oracle RAC or a Data Guard configuration. Regarding their behavior and performance when connected to a physical standby database with Real-Time Query enabled:

A: The usage of Global Sequences can indeed have a performance impact on the primary database due to the need to generate unique values that are consistent across both primary and standby databases.

D: The performance impact on the physical standby database may occur if the CACHE size is too small. This is because the standby database will frequently have to access the primary database to replenish the cache, which can increase the load and potentially lead to performance degradation.

E: Global Sequences should have the NOORDER and CACHE options set. The NOORDER option ensures that sequence numbers are provided without guaranteeing sequence order, thus improving scalability and performance. The CACHE option is used to specify how many sequence values will be held in memory for faster access.

Option B is incorrect as the LOG_ARCHIVE_DEST_n parameter's definition for standbys pointing back to the primary does not

directly pertain to the creation of sequences.

Option C is incorrect because there is no requirement that the size of the cache for a sequence must be at least 100. The CACHE size can be set to a different number based on specific use cases or performance considerations.

NEW QUESTION # 62

Which three types of backups offload with the primary database in a data Guard

- A. Data files
- B. Broker configuration files
- C. Online logs
- D. Password files
- E. Archive logs
- F. Control files

Answer: A,E,F

Explanation:

In a Data Guard environment, you can offload the backups of certain database components to a physical standby database. Incremental backups of a standby database are interchangeable with the primary database, meaning you can apply a backup taken on a standby database to a primary database and vice versa. This includes control files, data files, and archive logs. Backups of control files and nonstandby control files are interchangeable. You can restore a standby control file on a primary database and a primary control file on a physical standby database, demonstrating their interchangeability and the ability to offload control file backups to one database in a Data Guard environment.

NEW QUESTION # 63

You created a physical standby database prodsbyi from the primary database prod using SQL and RMAN.

Which THREE are prerequisites for creating a Data Guard Broker configuration to manage these databases?

- A. A local net service name to enable connectivity to the PRODSBYI database instance must be defined on the primary database host.
- B. The primary database must have FORCE LOGGING enabled.
- C. The standby database must have supplemental logging enabled.
- D. The LOG_ARCHIVE_DEST_n parameters with the service attribute set must be cleared.
- E. The DG_BROKER_START parameter must be set to TRUE for both database instances.
- F. The primary database must have supplemental logging enabled.

Answer: A,E,F

Explanation:

When setting up a Data Guard Broker configuration for a primary database and its physical standby, the following prerequisites must be met:

* A: Oracle Net connectivity must be defined on both the primary and standby hosts to enable the respective database instances to communicate with each other.

* B: Supplemental logging is required on the primary database because it provides additional logging necessary for the standby database to be able to apply changes from the primary database accurately.

* F: The DG_BROKER_START parameter must be set to TRUE for both the primary and standby database instances. This parameter is used to start the Data Guard Broker process which manages the configuration.

Options C and D are not prerequisites for creating a Data Guard Broker configuration. Additionally, while FORCE LOGGING mode (option E) is recommended as a best practice to prevent possible data inconsistencies during media recovery, it is not a strict prerequisite for creating a Data Guard Broker configuration.

References: This guidance is based on Oracle's best practices for setting up Data Guard configurations, as found in the Oracle Data Guard Broker documentation and the Oracle Data Guard Concepts and Administration guide.

NEW QUESTION # 64

Which THREE statements are true..... open in real time query mode, which becomes a new.

- A. All current buffers can be retained.

- **B. All sessions are disconnected and all**
- C. User sessions and Current Buffers are maintained by default.
- D. Sessions that have long running queries can be retained.
- E. Sessions that are using database links
- **F. User sessions can be retained.**

Answer: A,B,F

Explanation:

When a physical standby database is opened in real-time query mode, which may be referred to as real-time apply when using Active Data Guard, certain operations can disrupt ongoing sessions. However, with features like Application Continuity and the proper configuration of initialization parameters such as STANDBY_DB_PRESERVE_STATES, user sessions and current buffers may be preserved during role transitions such as a switchover or failover. Specifically, the STANDBY_DB_PRESERVE_STATES parameter can be set to preserve none, all, or only user sessions during such transitions. This ensures that in-flight transactions are not lost and that users do not experience disruptions during the role transitions of a physical standby database.

All exam materials in 1z0-076 learning materials contain PDF, APP, and PC formats. They have the same questions and answers but with different using methods. If you like to take notes randomly according to your own habits while studying, we recommend that you use the PDF format of our 1z0-076 Study Guide. And besides, you can take it with you wherever you go for it is portable and takes no place. So the PDF version of our 1z0-076 exam questions is convenient.
