NEW QUESTION # 30

A systems administrator wants to prevent the current contents of a file from being overwritten and wants to allow new additions at the end of the file. Which of the following commands should the administrator use?

- A. `chattr +a file`
- B. `setenforce file`
- C. `chmod +t file`
- D. `setfacl -m m::t file`

Answer: A

The `chattr +a` command sets the append-only attribute on a file. This prevents overwriting or deletion of existing contents, while still allowing new data to be appended to the end of the file.

$ dig server1
[...]
;; QUESTION SECTION:
;server1. IN A
;; ANSWER SECTION:
server1. 0 IN A 192.168.0.2
[...]
```

Which of the following is the cause of the issue?

- A. The server load average is too high.
- B. The wrong protocol is being used to connect to the web server.
- **C. The SSH service has not been allowed on the firewall.**
- D. The DNS entry does not have a valid IP address.

Answer: C

Explanation:

The server is running and responding to pings, and DNS resolves correctly (dig server1 → 192.168.0.2). The ss -lnt output shows SSH (port 22) is listening, but the firewall (firewall-cmd -- list-all) does not list SSH among the allowed services. Therefore, external users cannot connect because the firewall is blocking SSH.
