Our SOA-C02 actual test guide can give you some help. Our company aims to help ease the pressure on you to prepare for the exam and eventually get a certificate. Obtaining a certificate is equivalent to having a promising future and good professional development. Our SOA-C02 Study Materials have a good reputation in the international community and their quality is guaranteed. Why don't you there have a brave attempt? You will certainly benefit from your wise choice.

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q311-Q316):

NEW QUESTION # 311

A SysOps administrator is deploying an application on 10 Amazon EC2 instances. The application must be highly available. The instances must be placed on distinct underlying hardware.
What should the SysOps administrator do to meet these requirements?

- A. Launch the instances into a spread placement group in single AWS Region
- B. Launch the instances into a partition placement group in multiple AWS Regions.
- C. Launch the instances into a cluster placement group in a single AWS Region.
- D. Launch the instances into a spread placement group in multiple AWS Regions.

Answer: A

Explanation:
To ensure high availability and that instances are placed on distinct underlying hardware, a spread placement group should be used.
Spread placement groups place instances on distinct hardware, reducing the risk of simultaneous failures.
* Create Spread Placement Group:
* Open the EC2 console at Amazon EC2 Console.
* Navigate to Placement Groups in the sidebar.
* Click Create placement group and select Spread for the strategy.
* Launch Instances:
* When launching new instances, select the placement group you created.
* Ensure the instances are in the same AWS Region but spread across distinct hardware.
* Verify Placement:
* After launching, verify that the instances are in the spread placement group by checking the instance details in the console.
Placement Groups
Creating a Spread Placement Group

NEW QUESTION # 312

A recent organizational audit uncovered an existing Amazon RDS database that is not currently configured for high availability. Given the critical nature of this database, it must be configured for high availability as soon as possible.
How can this requirement be met?

- A. Switch to an active/passive database pair using the create-db-instance-read-replica with the --availability-zone flag.
- B. Specify high availability when creating a new RDS instance, and live-migrate the data.
- C. Use the modify-db-instance command with the --na flag.
- D. Modify the RDS instance using the console to include the Multi-AZ option.

Answer: D

NEW QUESTION # 313

A company runs several workloads on AWS. The company identifies five AWS Trusted Advisor service quota metrics to monitor in

a specific AWS Region. The company wants to receive email notification each time resource usage exceeds 60% of one of the service quotas.

Which solution will meet these requirements?

- A. Create five Amazon CloudWatch alarms, one for each Trusted Advisor service quota metric.
  Configure an Amazon Simple Queue Service (Amazon SQS) queue for email notification each time that usage exceeds 60% of one of the service quotas.
- B. Use the AWS Service Health Dashboard to monitor each Trusted Advisor service quota metric.Configure an Amazon Simple Notification Service (Amazon SNS) topic for email notification each time that usage exceeds 60% of one of the service quotas.
- C. Use the AWS Service Health Dashboard to monitor each Trusted Advisor service quota metric.
  Configure an Amazon Simple Queue Service (Amazon SQS) queue for email notification each time that usage exceeds 60% of one of the service quotas.
- D. Create five Amazon CloudWatch alarms, one for each Trusted Advisor service quota metric.
  Configure an Amazon Simple Notification Service (Amazon SNS) topic for email notification each time that usage exceeds 60% of one of the service quotas.

Answer: D

Explanation:
Setting up the Alarms, then sending emails via SNS should do the job.

NEW QUESTION # 314

A company has created an AWS CloudFormation template that consists of the AWS: EC2 Instance resource and a custom Cloud Formation resource The custom CloudFormation resource is an AWS Lambda function that attempts to run automation on the Amazon EC2 instance.

During testing, the Lambda function fails because the Lambda function tries to run before the EC2 instance is launched Which solution will resolve this issue?

- A. Add a DependsOn attribute to the custom resource. Specify the EC2 instance in the DependsOn attribute.
- B. Update the custom resource's service token to point to a valid Lambda function
- C. Update the Lambda function to use the cfn-response module to send a response to the custom resource.
- D. Use the Fn::If intrinsic function to check for the EC2 instance before the custom resource runs.

Answer: A

Explanation:
DependsOn Attribute in CloudFormation:
* The DependsOn attribute in AWS CloudFormation ensures that one resource is created only after another resource has been successfully created. In this case, it ensures that the EC2 instance is fully launched before the custom resource (the Lambda function) is executed.
* Steps:
* Update the CloudFormation template to include the DependsOn attribute for the custom resource.
* Ensure that the custom resource references the EC2 instance.
Resources:
MyEC2Instance:
Type: AWS::EC2::Instance
Properties:
EC2 properties
MyCustomResource:
Type: Custom::MyCustomResource
DependsOn: MyEC2Instance
Properties:
ServiceToken: !GetAtt MyLambdaFunction.Arn
Other properties
1: AWS CloudFormation DependsOn Attribute

NEW QUESTION # 315

A company hosts its website in the us-east-1 Region. The company is preparing to deploy its website into the eu-central-1 Region.

Website visitors who are located in Europe should access the website that is hosted in eu-central-1. All other visitors access the website that is hosted in us-east-1. The company uses Amazon Route 53 to manage the website's DNS records.

Which routing policy should a SysOps administrator apply to the Route 53 record set to meet these requirements?

- A. Latency routing policy
- B. Geoproximity routing policy
- C. Geolocation routing policy
- D. Multivalue answer routing policy

Answer: C

Explanation:
Reference:
geolocation "Geolocation routing lets you choose the resources that serve your traffic based on the geographic location of your users, meaning the location that DNS queries originate from. For example, you might want all queries from Europe to be routed to an ELB load balancer in the Frankfurt region." Could be confused with geoproximity - "Geoproximity routing lets Amazon Route 53 route traffic to your resources based on the geographic location of your users and your resources. You can also optionally choose to route more traffic or less to a given resource by specifying a value, known as a bias. A bias expands or shrinks the size of the geographic region from which traffic is routed to a resource" the use case is not needed as per question.
https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/routing-policy.html

NEW QUESTION # 316
......

The Test4Sure is one of the best platforms that has been helping the SOA-C02 exam candidates for many years.
