220-1101 Valid Braindumps Files - 220-1101 Practical Information

Test4Cram offers the 220-1101 exam questions in a convenient PDF format, allowing you to easily download them on your PC, laptop, Mac, tablet, or smartphone. With this accessibility, you can access the CompTIA 220-1101 PDF questions anytime and from anywhere. Having all the information about the CompTIA A+ Certification Exam: Core 1 (220-1101) Exam at your fingertips enhances your studying experience, making it easier and more effective, whether you're at home or on the go.

CompTIA 220-1101 Exam is an important step towards obtaining the CompTIA A+ certification. 220-1101 exam covers a wide range of IT topics and requires a solid understanding of computer hardware, software, networking, security, and troubleshooting. Candidates who pass the exam will have demonstrated the skills and knowledge required to perform entry-level IT support roles.

CompTIA A+ Certification Exam: Core 1 Sample Questions (Q119-Q124):

NEW QUESTION # 119

A user is printing a part with a thermoplastic polyurethane (TPU) filament on a 3-D printer. The first layer on every print job is not adhering properly.

Which of the following should the user do to improve adherence on the first layer?

- A. Raise the filament flow amount.
- B. Increase the print speed.
- C. Adjust the RPM of the cooling fan.
- D. Lower the print bed temperature.

Answer: A

Explanation:

The correct answer is D. Raise the filament flow amount.

Filament flow amount, also known as extrusion multiplier or flow rate, is the setting that controls how much filament is extruded by the nozzle during 3D printing. It is usually expressed as a percentage of the default value, which is 100%. Increasing the filament flow amount means extruding more filament than usual, while decreasing it means extruding less¹.

The filament flow amount can affect the quality and adhesion of the first layer, which is crucial for a successful 3D print. If the filament flow amount is too low, the nozzle may not extrude enough filament to fill the gaps between the lines and create a smooth and solid first layer. This can result in poor adhesion, curling, warping, or detachment of the print from the bed².

To improve adherence on the first layer, the user should raise the filament flow amount slightly, such as 105% or 110%, to ensure that enough filament is extruded to create a strong bond with the bed. The user should also make sure that the nozzle height, bed leveling, and bed temperature are properly calibrated for optimal first layer adhesion².

The other options are less likely to improve adherence on the first layer, because:

*Lowering the print bed temperature may reduce the adhesion of the TPU filament to the bed, as TPU usually requires a bed temperature between 20-60°C for the best results³. Lowering the bed temperature may also increase the risk of warping or curling of the print⁴.

*Adjusting the RPM of the cooling fan may not have a significant effect on the first layer adhesion, as cooling fans are not required with TPU³. In fact, using a cooling fan with TPU may cause cracking or delamination of the print, as TPU needs to cool down slowly and evenly⁴.

*Increasing the print speed may worsen the first layer adhesion, as TPU is a flexible and elastic filament that needs to be printed slowly and consistently. A recommended print speed for TPU is 15-30mm/s³. Increasing the print speed may cause clogging, stringing, blobs, or under-extrusion of the filament⁴.

NEW QUESTION # 120

When a user touches or swipes across an external touch screen, the image flickers but no input is registered on the presentation laptop. A technician verifies that the external touch screen appears free from physical damage.

Which of the following should the technician do next?

- A. Reboot the LCD touch panel and laptop.
- B. Inspect the LCD touch panel for dead pixels or burn-in.
- C. Verify the correct input source is set on the laptop.
- D. Replace the laptop with a new device that is known to work.
- E. Check the cables connecting to the laptop.

Answer: E

Explanation:

When an external touch screen exhibits flickering without registering input on a presentation laptop, the first troubleshooting step should be to check the cables connecting the touch screen to the laptop. This includes ensuring that the cables are securely connected, undamaged, and are the correct type for transmitting both video and touch input data. Faulty, loose, or incorrect cabling can lead to issues like flickering and unregistered inputs.

NEW QUESTION # 121

A technician needs to install RAM into a rackmount server that will be used as a VM host. Which of the following would be BEST to install?

- A. SODIMM
- B. ECC
- C. VRAM
- D. DDR4

Answer: B

Explanation:

When installing RAM into a server that will be used as a VM host, it is recommended to install ECC (Error-Correcting Code) RAM to help prevent errors that can cause virtual machines to crash. Reference: <https://www.servermonkey.com/blog/ecc-vs-non-ecc-ram-what-are-the-differences.html> When installing RAM into a rackmount server that will be used as a VM host, it would be best to install ECC (Error Correcting Code) RAM which can detect and correct common types of data corruption.

NEW QUESTION # 122

A large office is eliminating all personal printers for VIP staff members and replacing these devices with one enterprise MFR. Human resources staff members are concerned about printing confidential documents on the new device. Which of the following best addresses this concern?

- A. Secure print
- B. Central printer server
- C. Audit logs
- D. Wi-Fi direct printing

Answer: A

NEW QUESTION # 123

The output from print jobs a user submitted to a laser printer is missing the color yellow. The user has already attempted a cleaning cycle. Which of the following parts most likely needs to be replaced?

- A. Toner tank
- B. Resin
- C. Fuser
- D. Ink cartridge
- E. Imaging drum

Answer: A
