Fortinet NSE 5 - FortiSIEM 6.3 Sample Questions (Q40-Q45):

NEW QUESTION # 40

FortiSIEM is deployed in disaster recovery mode.

When disaster strikes, which two tasks must you perform manually to achieve a successful disaster recovery operation? (Choose two.)

- A. Change the configuration for shared storage NFS configured for EventDB to the secondary FortiSIEM.
- B. Promote the secondary supervisor to the primary role using the `phSecondary2primary` command.
- C. Promote the secondary workers to the primary roles using the `phSecworker2priworker` command.

- **D. Change the DNS configuration to ensure that users, devices, and collectors log in to the secondary FortiSIEM.**

Answer: B,D

Explanation:

Disaster Recovery Mode: FortiSIEM's disaster recovery (DR) mode ensures that there is a backup system ready to take over in case the primary system fails.

Manual Tasks for DR Operation: In the event of a disaster, certain tasks must be performed manually to ensure a smooth transition to the secondary system.

Promoting the Secondary Supervisor:

* Use the command `phSecondary2primary` to promote the secondary supervisor to the primary role. This command reconfigures the secondary supervisor to take over as the primary supervisor, ensuring continuity in management and coordination.

Changing DNS Configuration:

* Update the DNS configuration to direct all users, devices, and collectors to the secondary FortiSIEM instance. This ensures that all components in the environment can communicate with the newly promoted primary supervisor without manual reconfiguration of individual devices.

References: FortiSIEM 6.3 Administration Guide, Disaster Recovery section, provides detailed steps on promoting the secondary supervisor and updating DNS configurations during a disaster recovery operation.

NEW QUESTION # 44

A customer is experiencing slow performance while executing long, adhoc analytic searches. Which FortiSIEM component can make the searches run faster?

- **A. Query worker**
- B. Correlation worker
- C. Event worker
- D. Storage worker

Answer: A

Explanation:

* **Component Roles in FortiSIEM:** Different components in FortiSIEM have specific roles and responsibilities, which contribute to the overall performance and functionality of the system.

* **Query Worker:** The query worker component is specifically designed to handle and optimize search queries within FortiSIEM. **Function:** It processes search requests and executes analytic searches efficiently, handling large volumes of data to provide quick results.

Optimization: By improving the efficiency of query execution, the query worker can significantly speed up long, ad hoc analytic searches, addressing performance issues.

* **Performance Impact:** Utilizing the query worker ensures that searches are handled by a component optimized for such tasks, reducing the load on other components and improving overall system performance.

* Reference: FortiSIEM 6.3 User Guide, System Components section, which describes the roles of different workers, including the query worker, and their impact on system performance.
