Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q23-Q28):

NEW QUESTION # 23

Which three benefits occur when operating an interior gateway protocol (IGP) in an autonomous system (AS)? (Choose three.)

- A. IGP's react very fast to network change.
- B. IGP's learn prefixes in the global Internet's routing table.
- C. IGP's automatically distribute static routing information.
- D. IGP's learn everything about the subnets and best paths within your network.
- E. IGP's determine the optimal paths for data transmission.

Answer: A,D,E

Explanation:

Operating an Interior Gateway Protocol (IGP) within an Autonomous System (AS) provides several benefits, including determining the optimal paths for data transmission (B), reacting quickly to network changes (D), and learning all about the subnets and best paths within the network (E). IGP's are designed to manage routing within a single AS efficiently, adapting to changes and ensuring data is routed through the best available paths.

NEW QUESTION # 24

You have configured some interfaces on a Junos device; however, you have not yet committed the configuration. What happens if you issue the rollback 0 command in this scenario?

- A. The interface changes you made are discarded.
- B. The messages.log file is deleted.
- C. The factory default configuration is loaded.
- D. The Junos device is rebooted.

Answer: A

Explanation:

Issuing the rollback 0 command in Junos OS will discard any uncommitted changes and revert to the last committed configuration. This command effectively cancels any configuration changes that have been made but not yet committed, ensuring that the device returns to its previous stable state.

Reference:

"rollback 0(rolls back the changes just made)" from Useful Juniper Commands.txt.

Juniper official documentation: Rolling Back a Configuration.

NEW QUESTION # 25

Which statement is correct concerning exception traffic processing?

- A. Exception traffic is rate-limited to protect the RE.
- B. Exception traffic is always dropped during congestion.
- C. Exception traffic is discarded by the PFE.
- D. Exception traffic is never forwarded.

Answer: A

Explanation:

Exception traffic refers to packets that the Packet Forwarding Engine (PFE) cannot process normally and must be forwarded to the Routing Engine (RE) for further processing. This includes packets destined for the router itself or packets needing special handling that the PFE cannot provide. To protect the RE from being overwhelmed by such traffic, which could potentially impact the router's control plane functions, exception traffic is rate-limited. This means that there's a threshold to how much exception traffic can be sent to the RE, ensuring that the router's critical management and control functions remain stable and responsive even during high traffic volumes or attacks.

NEW QUESTION # 26

How many rescue configuration files are supported on a Junos device?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: D

Explanation:

Junos OS supports only 1 rescue configuration file on a device. This rescue configuration is a safeguard feature that allows network administrators to revert to a known good configuration in case of a configuration error or issue, ensuring network stability.

In Junos OS, each device supports only one rescue configuration file. The rescue configuration is a specific configuration that can be saved and later retrieved if needed. This is used as a fallback configuration that you know works and can be applied in case of an emergency or if the current configuration has issues.

Reference: Juniper Networks Documentation on Rescue Configuration

"You can create a rescue configuration file by using the request system configuration rescue save operational mode command. Each Junos OS device can have only one rescue configuration file."

NEW QUESTION # 27

Which two addresses are included in an Ethernet frame header? (Choose two.)

- A. source MAC address
- B. destination MAC address
- C. destination IP address
- D. source IP address

Answer: A,B

Explanation:

An Ethernet frame header includes the source MAC address (B) and the destination MAC address (D). These addresses are used to deliver the frame from one Ethernet device to another directly connected Ethernet device on the same network segment. Ethernet frames do not include IP addresses, as those are part of the IP packet encapsulated within the Ethernet frame.
