

# Free PDF 2025 SAP C-ABAPD-2309: SAP Certified Associate - Back-End Developer - ABAP Cloud–High Hit-Rate Reliable Exam Labs

P.S. Free 2025 SAP C-ABAPD-2309 dumps are available on Google Drive shared by VCEdumps:  
<https://drive.google.com/open?id=1kqu-uszNFCsdXBS06oatWYMX98QZURMg>

It's not easy for most people to get the C-ABAPD-2309 guide torrent, but I believe that you can easily and efficiently obtain qualification certificates as long as you choose our products. After you choose our study materials, you can master the examination point from the C-ABAPD-2309 Guide question. Then, you will have enough confidence to pass your exam. As for the safe environment and effective product, why don't you have a try for our C-ABAPD-2309 question torrent, never let you down!

The C-ABAPD-2309 prep torrent we provide will cost you less time and energy. You only need relatively little time to review and prepare. After all, many people who prepare for the C-ABAPD-2309 exam, either the office workers or the students, are all busy. But the C-ABAPD-2309 test prep we provide are compiled elaborately and it makes you use less time and energy to learn and provide the C-ABAPD-2309 Study Materials of high quality and seizes the focus the C-ABAPD-2309 exam. It lets you master the most information and costs you the least time and energy.

## 100% Pass Quiz Efficient SAP - C-ABAPD-2309 - SAP Certified Associate - Back-End Developer - ABAP Cloud Reliable Exam Labs

VCEdumps exam dumps have two version-PDF and SOFT version which will give you convenient. It is very convenient for you to use PDF real questions and answers. And you can download these materials and print it out for study at any time. The SOFT version simulates the real exam which will give you more realistic feeling. When you are faced with the real exam, you can pass SAP C-ABAPD-2309 test easily.

## SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q35-Q40):

### NEW QUESTION # 35

In RESTful Application Programming, which EML statement retrieves an object?

- A. Find entity
- **B. Get entity**
- C. Select entity
- D. Read entity

**Answer: B**

Explanation:  
Explanation

In RESTful Application Programming, the EML statement that retrieves an object is GET entity. The GET entity statement is used to read data of an entity instance from the database or the transaction buffer. The GET entity statement can specify the entity name, the entity key, and the entity elements to be retrieved. The GET entity statement can also use the IN LOCAL MODE addition to bypass the access control, authorization control, and feature control checks. The GET entity statement returns a single entity instance or raises an exception if no instance is found or multiple instances match the key.

The other EML statements are not used to retrieve an object, but have different purposes and effects. These statements are:

FIND entity: This statement is used to search for entity instances that match a given condition. The FIND entity statement can specify the entity name, the entity elements to be returned, and the condition to be applied. The FIND entity statement can also use

the IN LOCAL MODE addition to bypass the access control, authorization control, and feature control checks. The FIND entity statement returns a table of entity instances or an empty table if no instances match the condition.

**SELECT entity:** This statement is used to query data of entity instances from the database or the transaction buffer. The SELECT entity statement can specify the entity name, the entity elements to be returned, and the filter, order, and aggregation options to be applied. The SELECT entity statement can also use the IN LOCAL MODE addition to bypass the access control, authorization control, and feature control checks. The SELECT entity statement returns a table of entity instances or an empty table if no instances match the query.

**READ entity:** This statement is not a valid EML statement, but an ABAP statement. The READ statement is used to access a single row of an internal table using the table index or the table key. The READ statement can also use the TRANSPORTING addition to specify which fields should be returned, and the INTO addition to specify the target variable. The READ statement returns a single row of the internal table or raises an exception if no row is found or multiple rows match the key.

### NEW QUESTION # 36

What are valid statements? Note: There are 2 correct answers to this question.

- A. "param1" and "param2" are predefined names.
- **B. The code creates an exception object and raises an exception.**
- C. "zcxl" is a dictionary structure, and "param1" and "param2" are this structure.
- **D. "previous" expects the reference to a previous exception**

**Answer: B,D**

Explanation:

Explanation

The code snippet in the image is an example of using the RAISE EXCEPTION statement to raise a class-based exception and create a corresponding exception object. The code snippet also uses the EXPORTING addition to pass parameters to the instance constructor of the exception class<sup>12</sup>. Some of the valid statements about the code snippet are:

The code creates an exception object and raises an exception: This is true. The RAISE EXCEPTION statement raises the exception linked to the exception class zcxl and generates a corresponding exception object. The exception object contains the information about the exception, such as the message, the source position, and the previous exception<sup>12</sup>.

"previous" expects the reference to a previous exception: This is true. The previous parameter is a predefined parameter of the instance constructor of the exception class cx\_root, which is the root class of all class-based exceptions. The previous parameter expects the reference to a previous exception object that was caught during exception handling. The previous parameter can be used to chain multiple exceptions and preserve the original cause of the exception<sup>12</sup>.

You cannot do any of the following:

"zcxl" is a dictionary structure, and "param1" and "param2" are this structure: This is false. zcxl is not a dictionary structure, but a user-defined exception class that inherits from the predefined exception class cx\_static\_check. param1 and param2 are not components of this structure, but input parameters of the instance constructor of the exception class zcxl. The input parameters can be used to pass additional information to the exception object, such as the values that caused the exception<sup>12</sup>.

"param1" and "param2" are predefined names: This is false. param1 and param2 are not predefined names, but user-defined names that can be chosen arbitrarily. However, they must match the names of the input parameters of the instance constructor of the exception class zcxl. The names of the input parameters can be declared in the interface of the exception class using the RAISING addition<sup>12</sup>.

### NEW QUESTION # 37

You want to define the following CDS view entity with an input parameter:

Define view entity Z\_CONVERT With parameters currency : ???

Which of the following can you use to replace "???" Note: There are 2 correct answers to this question.

- A. A component of an ABAP Dictionary structure
- B. A built-in ABAP Dictionary type
- C. A data element
- D. built-in ABAP type

**Answer: C,D**

Explanation:

Explanation

The possible replacements for "???" in the CDS view entity definition with an input parameter are A. built-in ABAP type and C. A data element. These are the valid types that can be used to specify the data type of an input parameter in a CDS view entity. A built-in ABAP type is a predefined elementary type in the ABAP language, such as abap.char, abap.numc, abap.dec, etc. A data element is a reusable semantic element in the ABAP Dictionary that defines the technical attributes and the meaning of a field<sup>12</sup>. For example:

The following code snippet defines a CDS view entity with an input parameter currency of type abap.cuky, which is a built-in ABAP type for currency key:

Define view entity Z\_CONVERT With parameters currency : abap.cuky as select from ... { ... } The following code snippet defines a CDS view entity with an input parameter currency of type waers, which is a data element for currency key:

Define view entity Z\_CONVERT With parameters currency : waers as select from ... { ... } You cannot do any of the following:

B). A built-in ABAP Dictionary type: This is not a valid type for an input parameter in a CDS view entity. A built-in ABAP Dictionary type is a predefined elementary type in the ABAP Dictionary, such as CHAR, NUMC, DEC, etc. However, these types cannot be used directly in a CDS view entity definition. Instead, they have to be prefixed with abap. to form a built-in ABAP type, as explained above<sup>12</sup>.

D). A component of an ABAP Dictionary structure: This is not a valid type for an input parameter in a CDS view entity. A component of an ABAP Dictionary structure is a field that belongs to a structure type, which is a complex type that consists of multiple fields. However, an input parameter in a CDS view entity can only be typed with an elementary type, which is a simple type that has no internal structure<sup>12</sup>.

### NEW QUESTION # 38

Using ABAP SQL, which select statement selects the mat field on line #17?

- A. SELECT mat FROM demo\_sales\_cds\_so\_i ve...
- B. SELECT mat FROM demo\_sales\_so\_i..
- C. SELECT mat FROM Material...
- D. SELECT mat FROM demo sales cds material ve...

**Answer: A**

Explanation:

#### Explanation

Using ABAP SQL, the select statement that selects the mat field on line #17 is:

```
SELECT mat FROM demo_sales_cds_so_i_ve...
```

This statement selects the mat field from the CDS view demo\_sales\_cds\_so\_i\_ve, which is defined on line #1.

The CDS view demo\_sales\_cds\_so\_i\_ve is a projection view that projects the fields of the CDS view demo\_sales\_cds\_so\_i, which is defined on line #2. The CDS view demo\_sales\_cds\_so\_i is a join view that joins the fields of the database table demo\_sales\_so\_i, which is defined on line #3, and the CDS view demo\_sales\_cds\_material\_ve, which is defined on line #4. The CDS view demo\_sales\_cds\_material\_ve is a value help view that provides value help for the material field of the database table

demo\_sales\_so\_i. The mat field is an alias for the material field of the database table demo\_sales\_so\_i, which is defined on line #91.

The other options are not valid because:

A: SELECT mat FROM Material... is not valid because Material is not a valid data source in the given code. There is no CDS view or database table named Material.

C: SELECT mat FROM demo\_sales\_so\_i... is not valid because demo\_sales\_so\_i is not a valid data source in the given code.

There is no CDS view named demo\_sales\_so\_i, only a database table. To access a database table, the keyword TABLE must be used, such as SELECT mat FROM TABLE demo\_sales\_so\_i...

D: SELECT mat FROM demo sales cds material ve... is not valid because demo sales cds material ve is not a valid data source in the given code. There is no CDS view or database table named demo sales cds material ve. The correct name of the CDS view is demo\_sales\_cds\_material\_ve, with underscores instead of spaces.

#### NEW QUESTION # 39

Which type of legacy code does SAP recommend you eliminate when you review modifications as part of an SAP S/4HANA system conversion? Note: There are 2 correct answers to this question.

- A. Code that can be redesigned as a key user extension
- B. Code that now is identical to a standard SAP object
- C. Code that supports a critical business process
- D. Code that has less than 10% usage according to usage statistics

**Answer: A,B**

#### Explanation:

SAP recommends that you eliminate the following types of legacy code when you review modifications as part of an SAP S/4HANA system conversion:

\* Code that now is identical to a standard SAP object. This type of code is redundant and unnecessary, as it does not provide any additional functionality or customization. It can also cause conflicts or errors during the system conversion, as the standard SAP object may have changed or been replaced in SAP S/4HANA. Therefore, you should delete this type of code and use the standard SAP object instead.

\* Code that can be redesigned as a key user extension. This type of code is usually related to UI or business logic adaptations that can be achieved using the in-app tools provided by SAP S/4HANA. By redesigning this type of code as a key user extension, you can simplify and standardize your code base, reduce maintenance efforts, and avoid compatibility issues during the system conversion. Therefore, you should migrate this type of code to the key user extensibility framework and delete the original code.

The other types of legacy code are not recommended to be eliminated, as they may still be relevant or necessary for your business processes. However, you should still review and adjust them according to the SAP S/4HANA simplification items and best practices. These types of code are:

\* Code that supports a critical business process. This type of code is essential for your business operations and cannot be easily replaced or removed. However, you should check if this type of code is compatible with SAP S/4HANA, and if not, you should adapt it accordingly. You should also consider if this type of code can be optimized or enhanced using the new features and capabilities of SAP S/4HANA.

\* Code that has less than 10% usage according to usage statistics. This type of code is rarely used and may not be worth maintaining or converting. However, you should not delete this type of code without verifying its relevance and impact on your business processes. You should also consider if this type of code can be replaced or consolidated with other code that has higher usage or better performance.

#### NEW QUESTION # 40

.....

As we all know, it is difficult to prepare the C-ABAPD-2309 exam by ourselves. Excellent guidance is indispensable. If you urgently need help, come to buy our study materials. Our company has been regarded as the most excellent online retailers of the C-ABAPD-2309 exam question. So our assistance is the most professional and superior. You can totally rely on our study materials to pass the exam. All the key and difficult points of the C-ABAPD-2309 exam have been summarized by our experts. They have rearranged all contents, which is convenient for your practice. Perhaps you cannot grasp all crucial parts of the C-ABAPD-2309 Study Tool by yourself. You also can refer to other candidates' review guidance, which might give you some help. Then we can offer you a variety of learning styles. Our printable C-ABAPD-2309 real exam dumps, online engine and windows software are popular among candidates. So you will never feel bored when studying on our C-ABAPD-2309 study tool.
