CWNP Certified Wireless Design Professional Sample Questions (Q174-Q179):

NEW QUESTION # 174

When surveying an existing WLAN infrastructure for a possible redesign, you use two Wi-Fi USB adapters to collect RSSI data and two USB spectrum analysis adapters to collect RF spectrum data. Since your laptop doesn't have enough USB ports, you use a 4-port powered USB 3.0 hub.

What issues could be caused by the use of USB 3.0 that will impact your site survey?

- A. It generates noise in the 2.4 GHz band, giving you a false perception of the noise floor.

- B. It does not give you enough power for all four of your adapters.
- C. It does not give you enough bandwidth to collect data coming from all of the adapters.
- D. It generates noise in the 5 GHz band, giving you a false perception of the noise floor.

Answer: A

NEW QUESTION # 175

In high-density environments like stadiums or convention centers, what additional factor must be considered that can attenuate Wi-Fi signals during events?

- A. Fire doors
- B. Thick walls
- C. I-Beams
- **D. People**

Answer: D

Explanation:

In high-density venues such as stadiums or convention centers, the presence of large crowds significantly impacts Wi-Fi signal propagation. Human bodies consist mostly of water, which absorbs and attenuates radio frequency (RF) signals, especially in the 2.4 GHz and 5 GHz bands commonly used by Wi-Fi. This absorption leads to reduced signal strength and potential connectivity issues during events when the venue is filled with people.

Designing a WLAN for such environments requires careful consideration of crowd density and its impact on RF signals. Strategies may include increasing the number of APs, using directional antennas to focus coverage, and conducting site surveys during events to assess real-world performance.

What should be EIRP of the APs in the design?

- A. 6.25 mW
- **B. 17 dBm**
- C. 11 dBm
- D. 125 mW

Answer: B

NEW QUESTION # 178
