Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q150-Q155):

NEW QUESTION # 150

What is the purpose of a firewall in endpoint security?

- A. Prevent unauthorized access to the endpoint
- B. Encrypt the data transmitted between the endpoint and the network
- C. Protect the endpoint from malware
- D. Monitor and detect suspicious activities on the endpoint

Answer: A

Explanation:

Firewalls are a key component of endpoint security as they help prevent unauthorized access to the endpoint. Firewalls work by examining incoming and outgoing network traffic and applying a set of rules to allow or block specific connections. By filtering and monitoring network traffic, firewalls act as a barrier between the endpoint and potential threats, such as hackers or unauthorized users, ensuring only authorized and secure connections are established.

NEW QUESTION # 151

What is the purpose of encryption in network security?

- A. To monitor and detect network attacks
- B. To authenticate and authorize users
- C. To protect the confidentiality and integrity of data during transmission
- D. To prevent unauthorized physical access to network devices

Answer: C

Explanation:

Encryption is the process of transforming data into an unintelligible form (ciphertext) to protect its confidentiality and integrity during transmission. It ensures that even if the data is intercepted, it cannot be understood or modified without the encryption key. Encryption helps in safeguarding sensitive information from unauthorized access and tampering.

NEW QUESTION # 152

Which of the following practices help in preserving the physical integrity of digital evidence?

- A. Storing the evidence in a cold, damp environment.
- B. Cleaning the evidence using chemical solvents.
- C. Leaving the evidence exposed to natural light.
- D. Using non-conductive gloves when handling the evidence.

Answer: D

Explanation:

Preserving the physical integrity of digital evidence is essential to prevent contamination or damage. Using non-conductive gloves is one such practice as it prevents the transfer of oils, dirt, or other substances that could potentially damage or alter the evidence. This helps to maintain the integrity of the evidence and ensures that any potential traces or fingerprints left on the evidence are not compromised.

NEW QUESTION # 153

Which type of encryption algorithm uses two different keys: a public key for encryption and a private key for decryption?

- A. Asymmetric encryption
- B. HMAC algorithm
- C. Symmetric encryption
- D. Hashing algorithm

Answer: A

Explanation:

Asymmetric encryption, also known as public-key encryption, uses a pair of keys: a public key and a private key. The public key is used for encryption, while the private key is used for decryption. This allows for secure communication over an insecure channel, as the public key can be shared freely without compromising the security of the message.

NEW QUESTION # 154

Which of the following is a common technique used by malware to evade detection?

- A. Implementation of strong firewalls
- B. Continuous monitoring of network traffic
- C. Frequent system scans and updates
- D. Encryption of communication channels

Answer: D

Explanation:

Malware often utilizes encryption techniques to make its communication with command and control servers difficult to detect. Encryption helps in disguising the communication and prevents network security measures from intercepting or analyzing the malicious traffic.
