100% Pass The Best Tableau - TDA-C01 - Tableau Certified Data Analyst Exam Topics Pdf

Living in such a world where competitiveness is a necessity that can distinguish you from others, every one of us is trying our best to improve ourselves in every way. It has been widely recognized that the TDA-C01 exam can better equip us with a newly gained personal skill, which is crucial to individual self-improvement in today's computer era. With the certified advantage admitted by the test Tableau certification, you will have the competitive edge to get a favorable job in the global market. Here our TDA-C01 Study Materials are tailor-designed for you.

Tableau Certified Data Analyst Sample Questions (Q45-Q50):

NEW QUESTION # 45

You have a data source that contains data for every city in the United States. The following is a sample of the data. You need to use the City dimension to create a dynamic filter that shows the cities that have a population greater than one million. Which type of filter should you use?

- A. Top filter
- B. Wildcard filter
- C. Condition filter
- D. General filter

Answer: C

Explanation:

To use the City dimension to create a dynamic filter that shows the cities that have a population greater than one million, you should use a condition filter. A condition filter is a type of filter that shows only the values that meet a specified condition based on a measure or a calculation. You can create a condition filter by dragging a dimension to the Filters shelf and selecting Condition from the dialog box. Then you can enter a formula or choose an option that defines your condition.

In this case, you want to create a condition filter based on Population, which is a measure. You can drag City to the Filters shelf and select Condition from the dialog box. Then you can choose By field from the tab and select Population > Sum > Greater than > 1000000 from the drop-down lists. This will create a condition filter that shows only the cities that have a sum of population greater than one million.

The other options are not correct for this scenario. A general filter is not a specific type of filter, but a term that refers to any type of filter in Tableau. A wildcard filter is a type of filter that shows only the values that match a specified pattern or string, such as "New*" or "*ton". A top filter is a type of filter that shows only the top or bottom N values of a measure or dimension based on a ranking or an aggregation. References:

NEW QUESTION # 46

You want to connect a Tableau workbook to a dataset in a Microsoft Excel spreadsheet. What should you do from Tableau Desktop?

- A. From the File menu select Import Workbook
- B. From the Data menu select New Data Source
- C. From the File menu select New
- D. From the Data menu select Replace Data Source

Answer: B

Explanation:

To connect a Tableau workbook to a dataset in a Microsoft Excel spreadsheet, you need to select New Data Source from the Data menu. This will open the Connect pane, where you can choose Microsoft Excel as your data source and browse for your spreadsheet file. You can then drag and drop your sheets or tables to join or union them in the data source page. Reference:

NEW QUESTION # 47

You want to ensure that when you click a bar on a dashboard, a tooltip appears that contains a link named "Click here to know more!" as shown in the following exhibit.

Answer:

Explanation:

NEW QUESTION # 48

You want to add a draft watermark to a dashboard as shown in the following exhibit.

Which type of object should you use?

- A. Web page
- B. Image
- C. Sheet
- D. Horizontal

Answer: A

NEW QUESTION # 49

You create a parameter named Choose Region that contains values from a field named Region.

You want users to be able to use the Choose Region parameter to interact with a chart by toggling between different regions. What should you do next?

- A. Add the [Region] = [choose Region] formula to the Filters card
- B. Set the Choose Region parameter to Single Value (list)
- C. Add the Choose Region parameter to the Pages card
- D. Add Region to the Filters card

Answer: D

Explanation:

To use the Choose Region parameter to interact with a chart by toggling between different regions, you should add the [Region] = [Choose Region] formula to the Filters card. This formula will create a boolean filter that returns TRUE if the value in the Region field matches the value in the Choose Region parameter, and FALSE otherwise. You can add this formula to the Filters card by right-clicking on it and selecting Add Filter from the menu. Then you can select Condition from the dialog box and enter the formula in the text box. This will filter the chart to show only the data for the selected region.

The other options are not correct for this scenario. Adding Region to the Filters card will create a categorical filter that shows a list of values from the Region field, but it will not use the Choose Region parameter. Adding the Choose Region parameter to the Pages card will create a page control that allows you to cycle through different values of the parameter, but it will not filter the chart. Setting the Choose Region parameter to Single Value (list) will change how the parameter control appears on the worksheet, but it will not affect how it interacts with the chart.
