MuleSoft Certified Developer - Level 2 (Mule 4) Sample Questions (Q25-Q30):

NEW QUESTION # 25

A Mule implementation uses a HTTP Request within an Unit Successful scope to connect to an API.

How should a permanent error response like HTTP:UNAUTHORIZED be handle inside Until Successful to reduce latency?

- A. In Until Successful configuration, set the retry count to 1 for error type HTTP: UNAUTHORIZED.
- **B. Put the HTTP Request inside a try scope in Unit Successful.**
In the error handler, use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED.
- C. Configure retrying until a MULERETRY_EXHAUSTED error is raised or the API responds back with a successful response.
- D. Put the HTTP Request inside a try scope in Unit Successful.
In the error handler, use On Error Propagate to catch permanent errors like HTTP UNAUTHORIZED.

Answer: B

Explanation:

To handle a permanent error response like HTTP:UNAUTHORIZED inside Until Successful, the developer should put the HTTP Request inside a try scope in Unit Successful, and use On Error Continue to catch permanent errors like HTTP UNAUTHORIZED in the error handler. This way, the developer can avoid retrying requests that will always fail due to a permanent error, and reduce latency. On Error Continue allows the flow to continue processing after handling the error. References:

NEW QUESTION # 26

When a client and server are exchanging messages during the mTLS handshake, what is being agreed on during the cipher suite exchange?

- A. The TLS version
- **B. An encryption algorithm**
- C. The Public key format
- D. A protocol

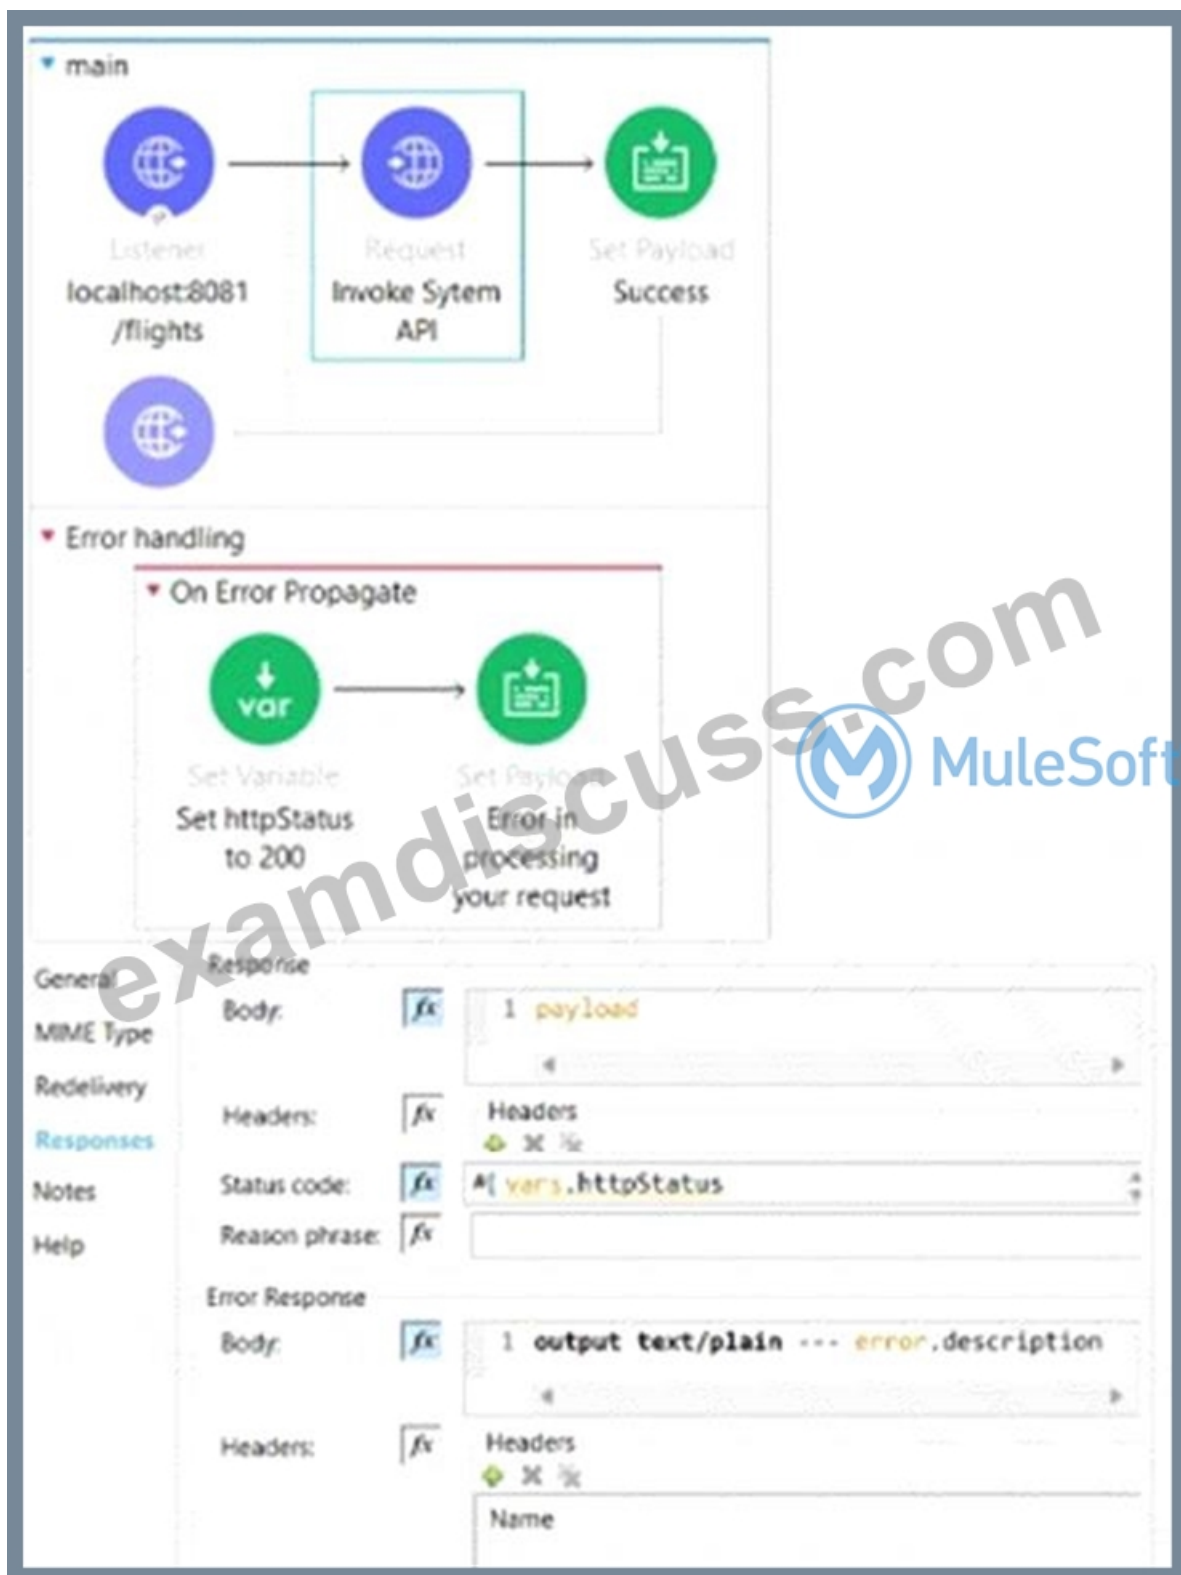

Answer: B

Explanation:

A cipher suite is a set of cryptographic algorithms that are used to secure the communication between a client and a server. A cipher suite consists of four components: a key exchange algorithm, an authentication algorithm, an encryption algorithm, and a message authentication code (MAC) algorithm. During the cipher suite exchange, the client and the server agree on which encryption algorithm to use for encrypting and decrypting the data. NEW QUESTION # 27

The HTTP Request operation raises an HTTP CONNECTIVITY error.
Which HTTP status code and body are returned to the web client?

- A. HTTP Status Code:500.
Body 'Error in processing your request'
- B. HTTP Status Code:500.
Body 'The HTTP CONNECTIVITY Error description'
- C. HTTP Status Code:500.
Body 'Error in processing your request'
- D. HTTP Status Code:200.
Body 'Error in processing your request'

Answer: A

Explanation:

When the HTTP Request operation raises an HTTP CONNECTIVITY error, it triggers an on-error-continue handler that sets a payload with 'Error in processing your request'. Since no status code is explicitly set in this handler, it defaults to 500 (INTERNAL SERVER ERROR). Therefore, the web client receives an HTTP response with status code 500 and body 'Error in processing your request'.

NEW QUESTION # 28

Which plugin or dependency is required to unit test modules created with XML SDK?

- A. MUnit Maven plugin
- B. XMLUnit
- C. Junit
- D. MUnit Extensions Maven plugin

Answer: D

Explanation:

Explanation

To unit test modules created with XML SDK, the developer needs to use the MUnit Extensions Maven plugin.

This plugin allows testing XML SDK modules using MUnit by adding a dependency to the module under test and using a custom processor tag to invoke it. References:

NEW QUESTION # 29

A developer has created the first version of an API designed for business partners to work commodity prices.

What should developer do to allow more than one major version of the same API to be exposed by the implementation?

- A. In Design Center, open the RAML and modify each operation to include the major version number
- B. In Anypoint Studio, generate scaffolding from the RAML, and then modify the flow names generated by APIKit to include a variable with the major version number
- C. In Anypoint Studio, generate scaffolding from the RAML, and then modify the <http:listener> in the generated flows to include a parameter to replace the version number
- D. In Design Center, open the RAML and modify baseUri to include a variable that indicates the version number

Answer: D

Explanation:

Explanation

To allow more than one major version of the same API to be exposed by the implementation, the developer should modify the baseUri property in the RAML file to include a variable that indicates the version number.

The baseUri property defines the base URL of the API and can include variables that are replaced with actual values when mocking or deploying the API. By using a variable for the version number, the developer can expose different versions of the API using different base URLs and avoid conflicts or confusion. References:
