The experts in our company have been focusing on the CWAP-405 examination for a long time and they never overlook any new knowledge. The content of our study materials has always been kept up to date. Don't worry if any new information comes out after your purchase of our CWAP-405 study guide. We will inform you by E-mail when we have a new version. With our great efforts, our study materials have been narrowed down and targeted to the CWAP-405 examination. So you don't need to worry about wasting your time on useless CWAP-405 exam materials information.

Our Certified Wireless Analysis Professional (CWAP-405) prep material also includes web-based and desktop Certified Wireless Analysis Professional (CWAP-405) practice tests for you to put your skills to the test. Our Certified Wireless Analysis Professional (CWAP-405) practice exams simulate the real Prepare for your Certified Wireless Analysis Professional (CWAP-405) exam environment, so you can experience the pressure and environment of the actual test before the day arrives. You'll receive detailed feedback on your performance, so you know what areas to focus on and improve.

CWAP-405 Valid Exam Objectives & CWAP-405 Latest Dumps Free

Our CWAP-405 study guide boosts high quality and we provide the wonderful service to the client. We boost the top-ranking expert team which compiles our CWAP-405 guide prep elaborately and check whether there is the update every day and if there is the update the system will send the update automatically to the client. The content of our CWAP-405 Preparation questions is easy to be mastered and seizes the focus to use the least amount of answers and questions to convey the most important information. And our quality of CWAP-405 exam questions is the best in this field for you to pass the CWAP-405 exam.

CWNP Certified Wireless Analysis Professional Sample Questions (Q22-

Q27):

NEW QUESTION # 22

What is encrypted within the third message of the 4-Way Handshake?

- A. GMK
- **B. GTK**
- C. PTK
- D. PMK

Answer: B

Explanation:

The GTK (Group Temporal Key) is encrypted within the third message of the 4-Way Handshake. The 4-Way Handshake is a process that establishes a secure connection between a STA (station) and an AP (access point) using WPA2 (Wi-Fi Protected Access 2), which is a security protocol that uses AES-CCMP (Advanced Encryption Standard-Counter Mode CBC-MAC Protocol) as its encryption algorithm. The 4-Way Handshake consists of four messages that are exchanged between the STA and the AP. The first message is sent by the AP to the STA, containing the ANonce (Authenticator Nonce), which is a random number generated by the AP. The second message is sent by the STA to the AP, containing the SNonce (Supplicant Nonce), which is a random number generated by the STA, and the MIC (Message Integrity Code), which is a value that verifies the integrity of the message. The third message is sent by the AP to the STA, containing the GTK, which is a key that is used to encrypt and decrypt multicast and broadcast data frames, and the MIC. The GTK is encrypted with the KEK (Key Encryption Key), which is derived from the PTK (Pairwise Temporal Key).

The PTK is a key that is used to encrypt and decrypt unicast data frames, and it is derived from the PMK (Pairwise Master Key), the ANonce, and the SNonce. The fourth message is sent by the STA to the AP, containing only the MIC, to confirm the completion of the 4-Way Handshake. The other options are not correct, as they are not encrypted within the third message of the 4-Way Handshake. The PMK is a key that is derived from a passphrase or obtained from an authentication server, and it is not transmitted in any message of the 4-Way Handshake. The PTK is a key that is derived from the PMK, the ANonce, and the SNonce, and it is not transmitted in any message of the 4-Way Handshake. The GMK (Group Master Key) is a key that is generated by the AP and used to derive the GTK, and it is not transmitted in any message of the 4-Way Handshake. NEW QUESTION # 23

You are tasked with describing the various frames used in 802.11 communications.

What frame is used for spectrum management, fast BSS transition and some other actions taken within a BSA?

- A. BlockAck
- **B. Action**
- C. CTS
- D. PS Poll

Answer: B

NEW QUESTION # 24

VoIP is used heavily in your organization. You must troubleshoot problems with dropped calls on the WLAN.

What is a common cause of dropped calls when using Wi-Fi VoIP phones?

- A. Data rates below 54 Mbps
- **B. Slow roaming**
- C. Use of WMM
- D. Data rates below 75 Mbps

Answer: B

NEW QUESTION # 25

How many frames are exchanged for 802.11 authentication in the 6 GHz band when WPA3-Enterprise is not used, and a passphrase is used instead?

- A. 0
- B. 1
- C. 2
- **D. 3**

Answer: D

Explanation:

Two frames are exchanged for 802.11 authentication in the 6 GHz band when WPA3-Enterprise is not used, and a passphrase is used instead. Authentication is a process that establishes an identity relationship between a STA (station) and an AP (access point) before joining a BSS (Basic Service Set). There are two types of authentication methods defined by 802.11: Open System Authentication and Shared Key Authentication.

Open System Authentication does not require any credentials or security information from a STA to join a BSS, and it consists of two frames: an Authentication Request frame sent by the STA to the AP, and an Authentication Response frame sent by the AP to the STA. Shared Key Authentication requires a shared secret key from a STA to join a BSS, and it consists of four frames: two challenge-response frames in addition to the request-response frames. However, Shared Key Authentication uses WEP (Wired Equivalent Privacy) as its encryption algorithm, which is insecure and deprecated. In the 6 GHz band, which is a newly available frequency band for WLANs, Shared Key Authentication is prohibited by the 802.11 standard, as it poses security and interference risks for other users and services in the band. The 6 GHz band requires all WLANs to use WPA3-Personal or WPA3-Enterprise encryption methods, which are more secure and robust than previous encryption methods such as WPA2 or WEP. WPA3-Personal uses a passphrase to derive a PMK (Pairwise Master Key), while WPA3-Enterprise uses an authentication server to obtain a PMK. Both methods use SAE (Simultaneous Authentication of Equals) as their authentication protocol, which replaces PSK (Pre-Shared Key) or EAP (Extensible Authentication Protocol). SAE consists of two frames: an SAE Commit frame sent by both parties to exchange elliptic curve parameters and nonces, and an SAE Confirm frame sent by both parties to verify each other's identities and generate a PMK. Therefore, when WPA3-Enterprise is not used, and a passphrase is used instead in the 6 GHz band, only two frames are exchanged for 802.11 authentication: an SAE Commit frame and an SAE Confirm frame. NEW QUESTION # 26

In what scenario is Open Authentication without encryption not allowed based on the 802.11 standard?

- A. When operating a BSS in FIPS mode
- B. When operating a BSS in the CBRS band
- C. When operating a BSS in a government facility
- **D. When operating a BSS in the 6 GHz band**

Answer: D

Explanation:

Open Authentication without encryption is not allowed when operating a BSS in the 6 GHz band, according to the 802.11 standard. Open Authentication is a type of authentication method that does not require any credentials or security information from a STA (station) to join a BSS (Basic Service Set). Open Authentication can be used with or without encryption, depending on the configuration of the BSS and the STA. Encryption is a technique that scrambles the data frames using an algorithm and a key to prevent unauthorized access or eavesdropping. However, in the 6 GHz band, which is a newly available frequency band for WLANs, Open Authentication without encryption is prohibited by the 802.11 standard, as it poses security and interference risks for other users and services in the band. The 6 GHz band requires all WLANs to use WPA3-Personal or WPA3-Enterprise encryption methods, which are more secure and robust than previous encryption methods such as WPA2 or WEP. The other options are not correct, as they do not describe scenarios where Open Authentication without encryption is not allowed by the 802.11 standard.

When operating a BSS in the CBRS band, which is another newly available frequency band for WLANs, Open Authentication without encryption is allowed, but not recommended, as it also poses security and interference risks for other users and services in the band. When operating a BSS in FIPS mode, which is a mode that complies with the Federal Information Processing Standards for cryptographic security, Open Authentication without encryption is allowed, but not compliant, as it does not meet the FIPS requirements for encryption algorithms and keys. When operating a BSS in a government facility, Open Authentication without encryption is allowed, but not advisable, as it may violate the government policies or regulations for wireless security.
